

INTRODUCTION :

Urbanization is the major problem to be concerned in the present scenario. Urbanization is the gradual increase in the proportion of people living in urban areas, and the ways in which each society adapts to this change. Which future leads to change in the land use pattern ,development control and many other issues.

TOWN PLANNING SCHEMES:

The basic concept of Town Planning Scheme is pooling together all the land under different ownerships and redistributing it in a properly reconstituted form after deducting the land required for the open spaces, social infrastructure, services, housing for the economically weaker section and road network.

- To achieve the objectives of the Development Plan. Town planning schemes are prepared giving micro level planning for smaller areas of about 50-100 hectares.
- The process enables the local authority to develop land without fully acquiring it and gives it a positive control over the design and the timing of the urban growth.
- This method was introduced through “Bombay Town Planning Act : 1915. later amended to New Bombay Town Planning Act: 1954, where this method is extensively used in Gujarat and Maharashtra.
- Town Planning Scheme on land pooling technique has been successfully used for plan implementation in Maharashtra, Gujarat, Tamil Nadu, Punjab and some other states.
- This facilitated assembly and development of urban land without resorting to compulsory land acquisition under Land Acquisition Act 1894.
- Through the mechanism of Town Planning Scheme urban local bodies launched land pooling and redistribution process in urban areas ensuring self-serviced planned and orderly development of towns and cities.
- TP scheme is basically an area planning technique patterned on the concept of land re-adjustment.

OBJECTIVES OF TOWN PLANNING SCHEMES:

- Pooling of land.
- Reconstruction of plot boundaries.
- Provision for social and physical infrastructure.
- Redistribution of reconstructed plots amongst original owners.
- Automatic acquisition of land for public purposes.
- Recovery of Betterment contribution to recover the cost of development.

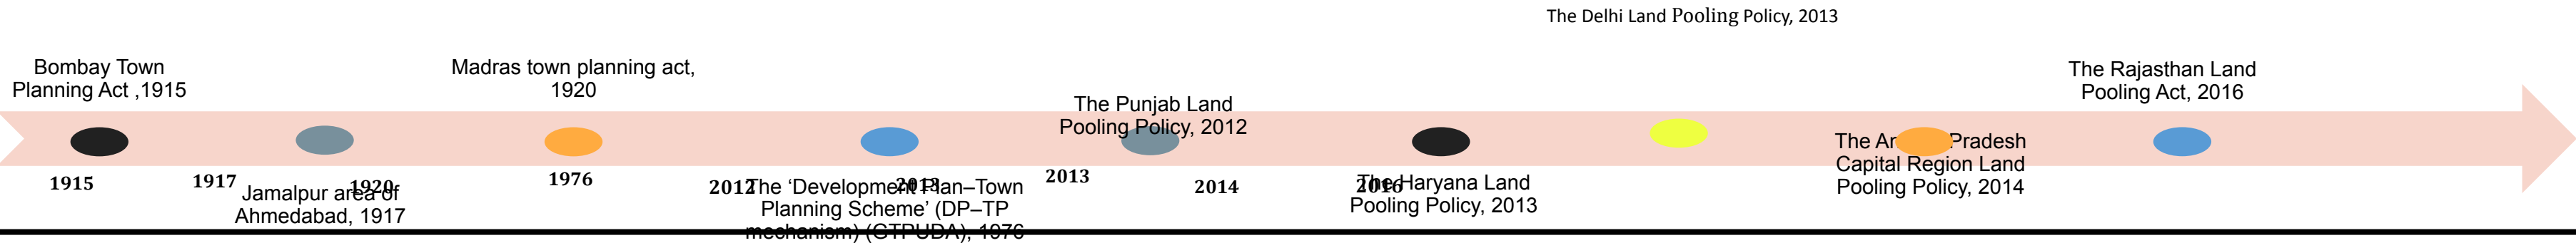

TP Scheme may be prepared for any land which is:

- In the course of development
- Likely to be used for residential, commercial or industrial or for building purpose.
- Already built upon.

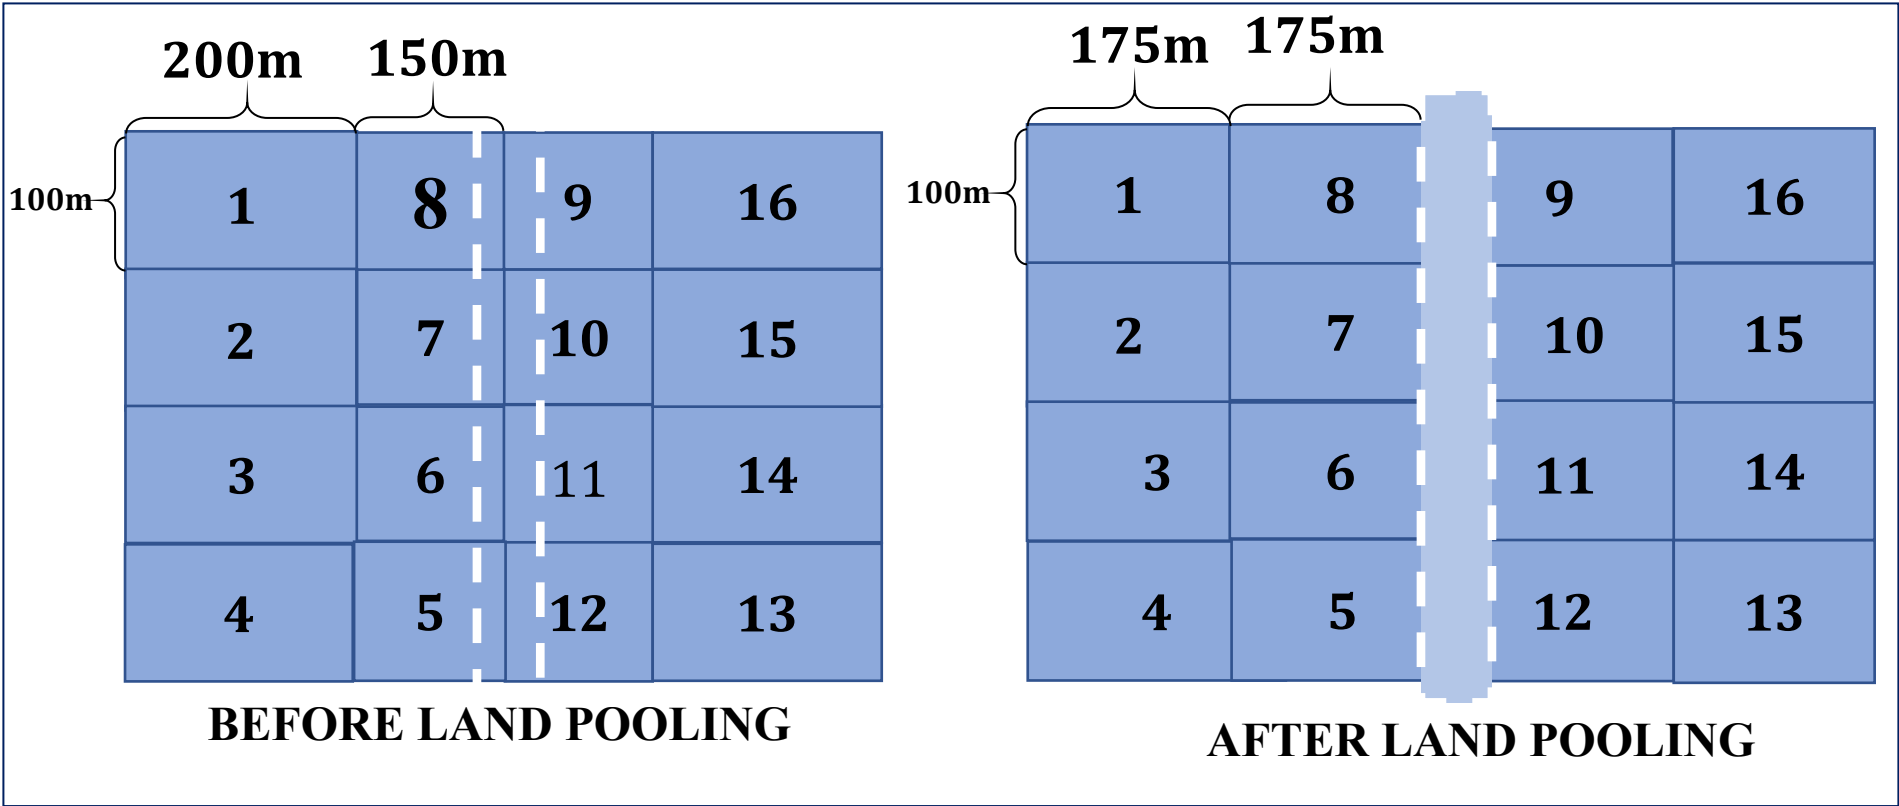

WHAT IS LAND POOLING ? AND WHY ?

The idea behind land pooling is to aggregate small land pieces into a large parcel, develop necessary infrastructure such as water supply, sewage system and drainage, make provision for larger social and other infrastructure, including metros and main roads, and return the developed land to owners or developers. Parts of this land parcel will be sold by the government to recover the cost of developing infrastructure and public spaces.

TIMELINE OF LANDPOOLING:

Land pooling will replace the process of land acquisition, wherein the government acquired land by giving a fixed compensation and the ownership changed hands. With complaints of low compensation and forceful acquisition, the system became unpopular in the last few years. The new policy is expected to unlock huge parcels of land for development and [affordable housing](#).

PROCESS OF LANDPOOLING :

PREDICTION OF DENSITIES

PREDICTION OF SPACE REQUIREMENTS FOR POPULATION

SPATIAL ORGANIZATION OF LAND FOR VARIOUS REQUIREMENTS

PROS AND CONS OF LAND POOLING:

PROS

- Difficulties in determining future loads on infrastructure
- No detailed land use plans are provided for the readjusted area.
- Where sites have already been sub-divided into small lots, it is difficult to assess contribution lands.

- Self-financing technique for urban land and infrastructure development.
- Equitable sharing of costs and profits among landowners affected by redevelopment.
- Substantial increases in the values of land

CONS

NEIGHBOURHOOD AREA PLANNING

TOPIC: LAND POOLING

AIM OF THE STUDY : Is to evolve an enabling framework for land pooling technique as a tool for effective plan implementation in the study area

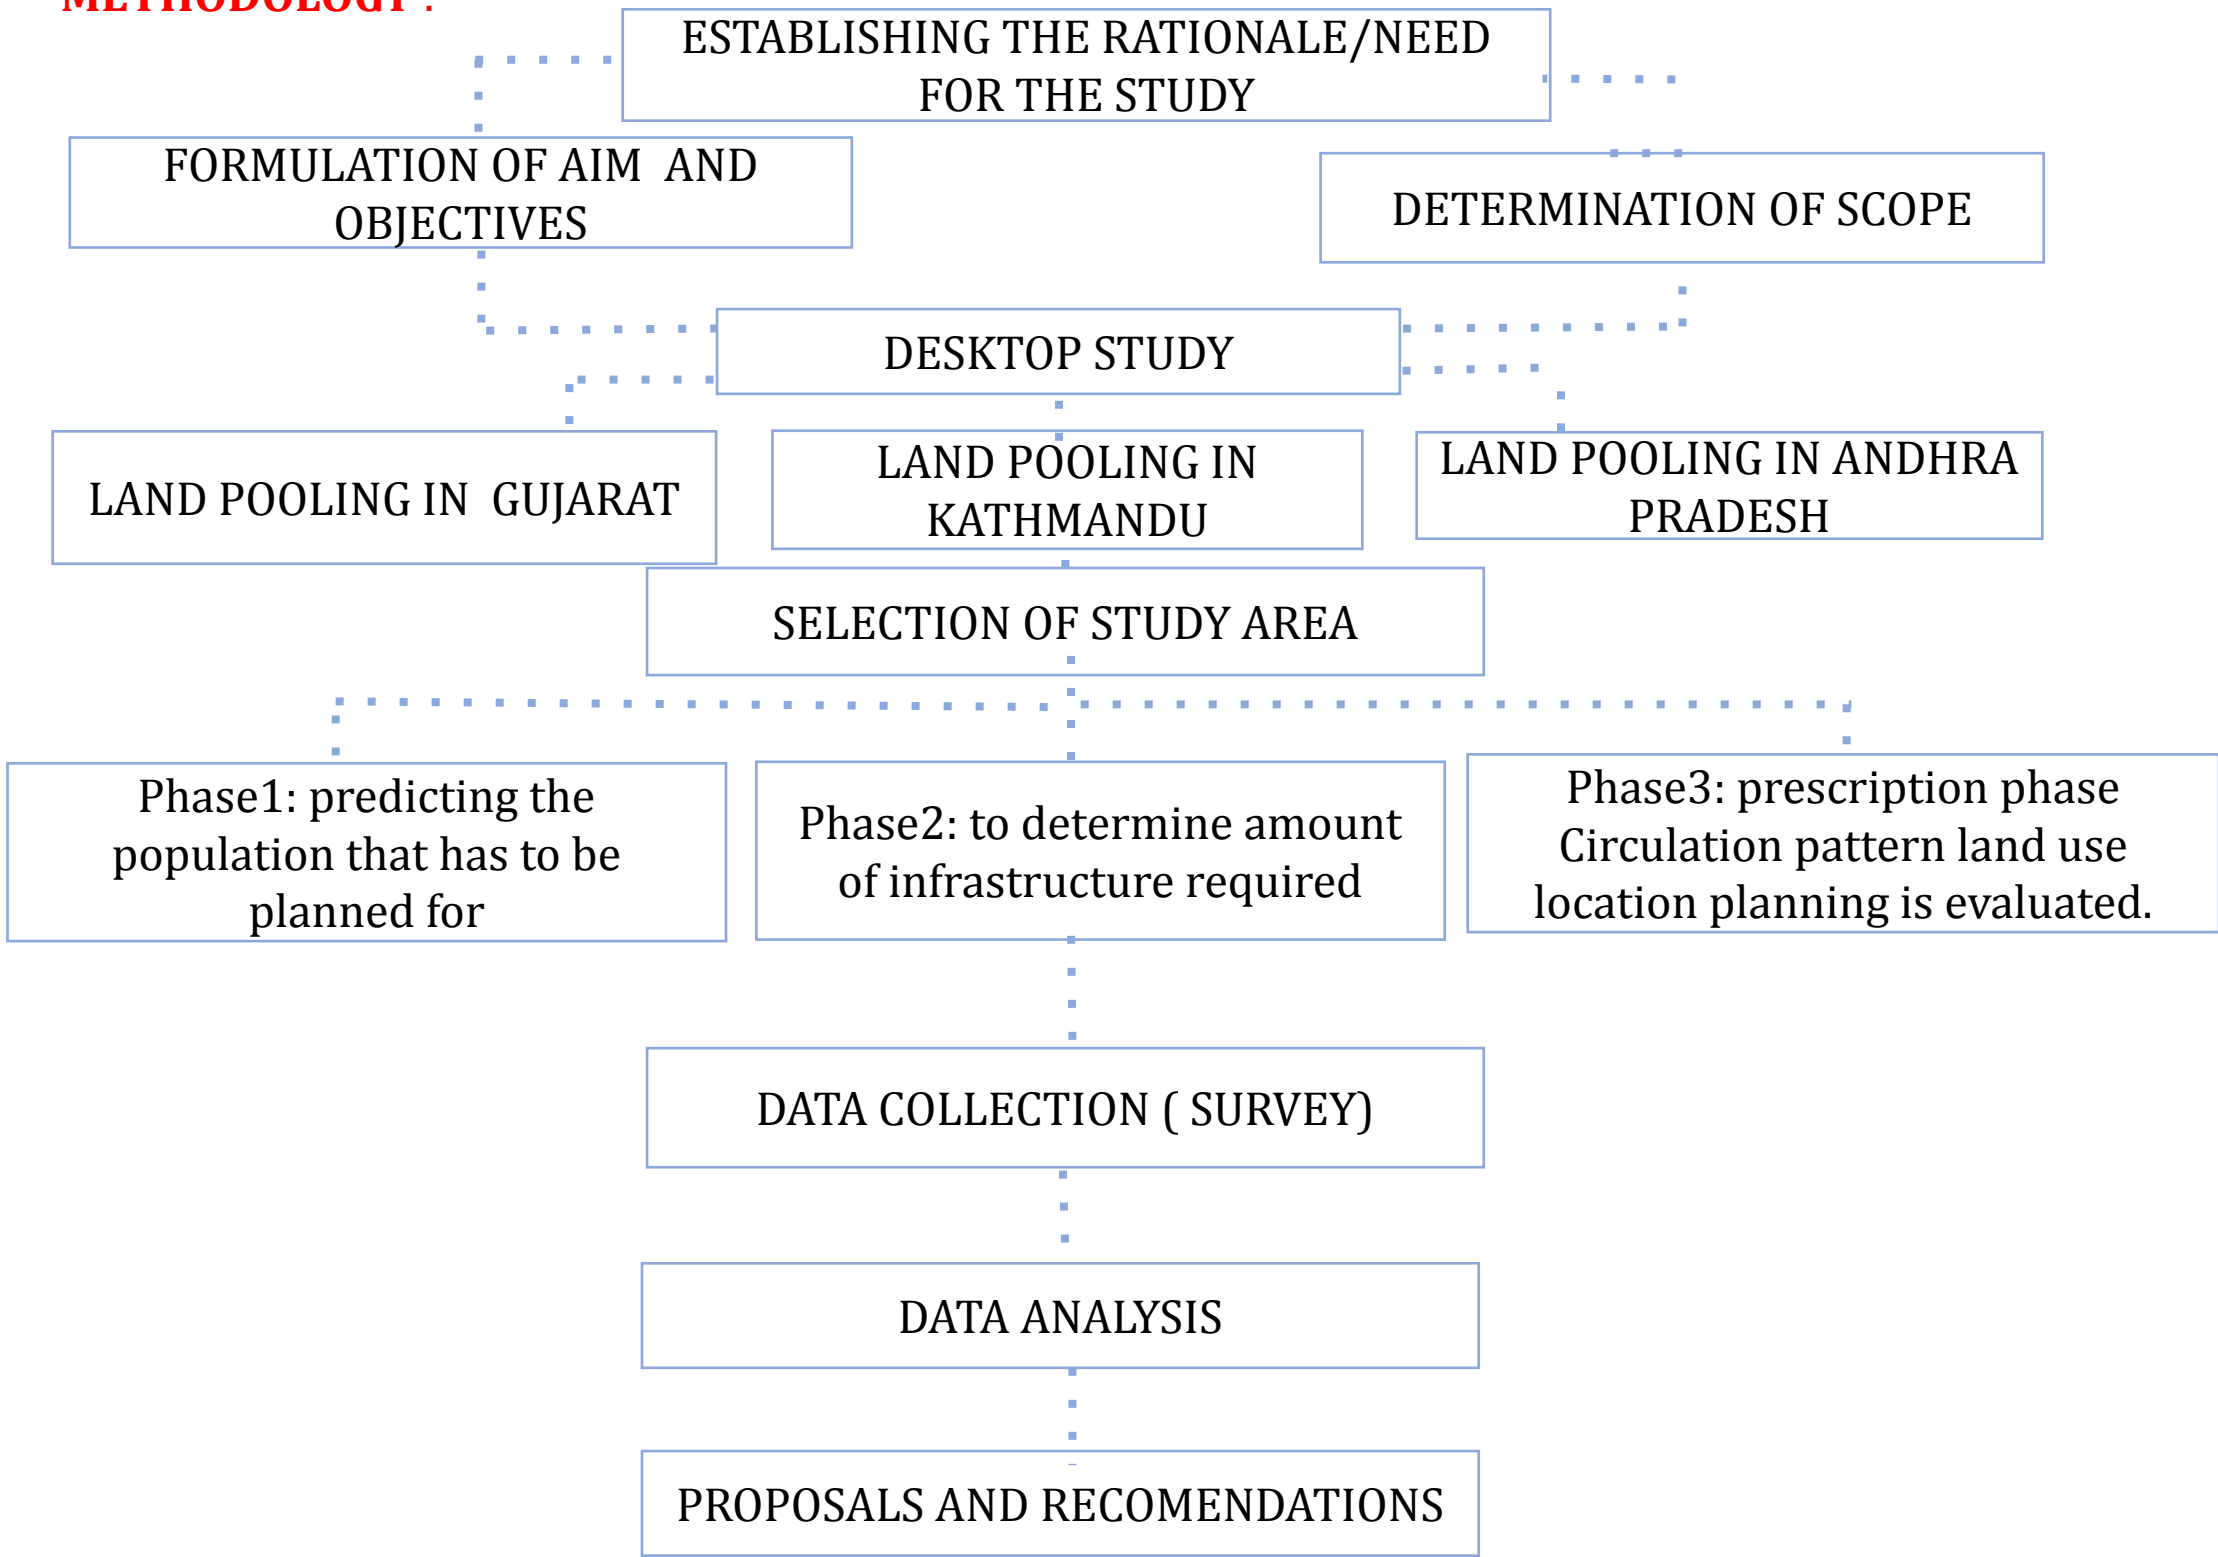

OBJECTIVES OF THE STUDY:

- 1. To study urban land management techniques
- 2. To understand the detailed implementation process of Land Pooling schemes
- 3. To describe the process, features and importance of land pooling schemes
- 4. To document the successful practice of land pooling scheme implementation
- 5. To suggest a development plan for the study area

SCOPE :

To enhance the living conditions of people and the raising needs of urban infrastructure development. No leap frog , land pooling would cut out the raise in unauthorized housing . Increase in the development of land parcels , increases the land value .

METHODOLOGY :

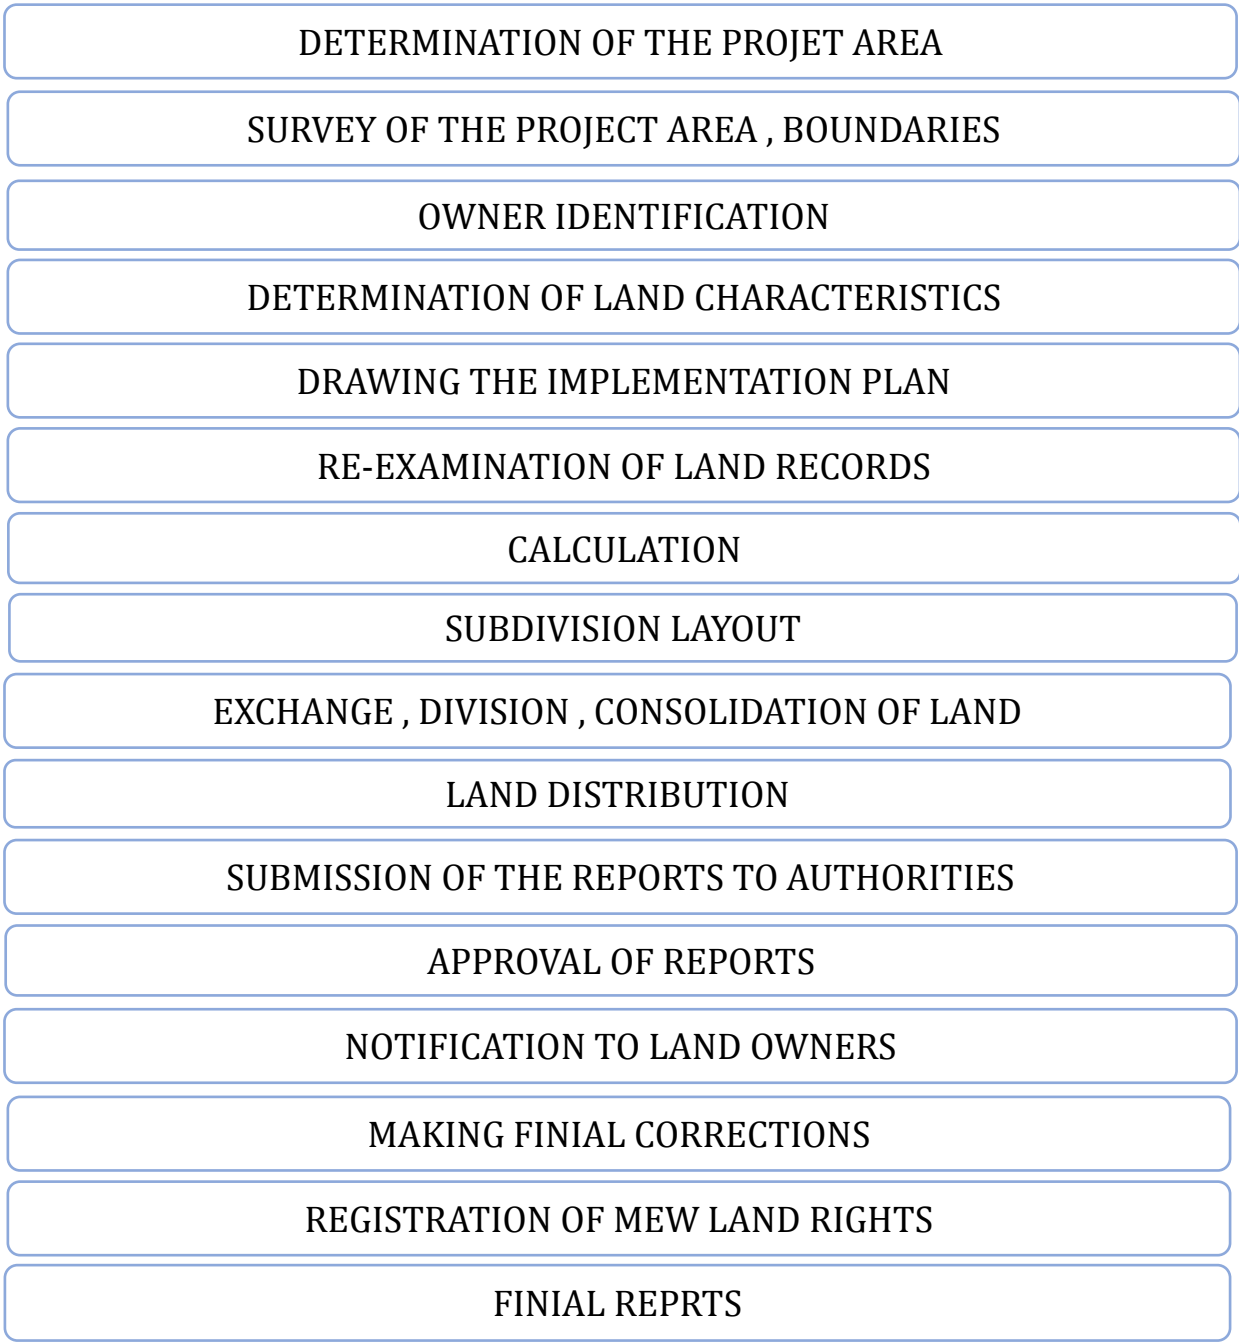

Benefits to owners :

- The build ability of plots increases with regularity of shape, improved accessibility , improved prospect of development.
- Improve quality of environment
- Increase market value , the owner receive compensation for land deducted.

Benefits to society :

- Planned development keeps pace with increase urbanization.
- Basic facilities to residents
- Appropriate transport network
- Efficient layout and acquisition of sites for public uses at direct locations.

PROCESS OF LANDPOOLING:

JUSTIFICATION :

- Land pooling ensures means to development.
- It ensures equity in loss and equity in gain(everyone looses land but gains more value for the reduced land than before.
- LP solves the issues of inconvenient development due to irregularly subdivided land.
- LANDPOOLING is not forceful unlike LAND ACQUISITION and does not have low compensations. It achieves planned and sustainable growth through co-operative public participation.
- LP provides affordable housing.
- LP is referred to as “Land Acquisition without tears”
- Land Pooling helps to provide plots for basic services in planned layout from the original haphazard arrangement.

LIMITATIONS:

- The study does not take into consideration the detailed individual plot layout planning
- Issues related to coat recovery
- Delay in the process of approval, attribution and implementation of plans mainly due to litigations

LAND POOLING IN GUJARAT :

Land pooling regime

- 1925 : First Town Pooling Scheme of Jamalpur in Gujarat
- 1954 : Amended Bombay Town Planning Legislation
- 1976 : New Act in Gujarat (GTPUD)Act, having more provisions
- 1995, 1999 & 2001 : Amendments in GTPUD Act.

Format:

Areas designated for urban expansion in the city’s development plan are;

- Divided into TP schemes of 100-1200 hectares covering 100-2000 parcels
- Government pools the land, uses 25-50% for roads, open space, other public purposes, including 5-10% for sale.
- The remaining 50-75% is returned to original owners, whose land value has increased

Land consolidation for: Development of greenfield & brownfield areas, Redevelopment of down towns, Infrastructure (addition & improvement)

Concept :

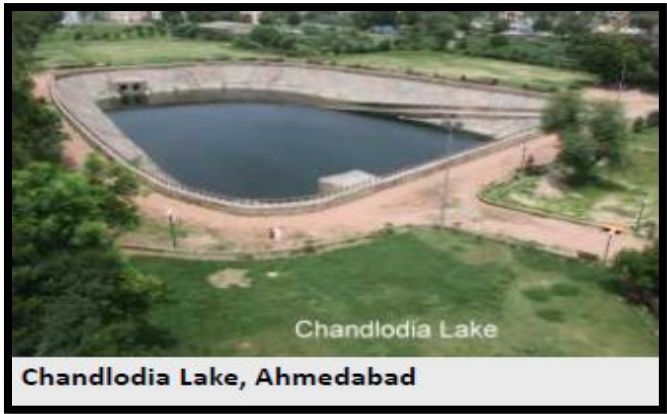

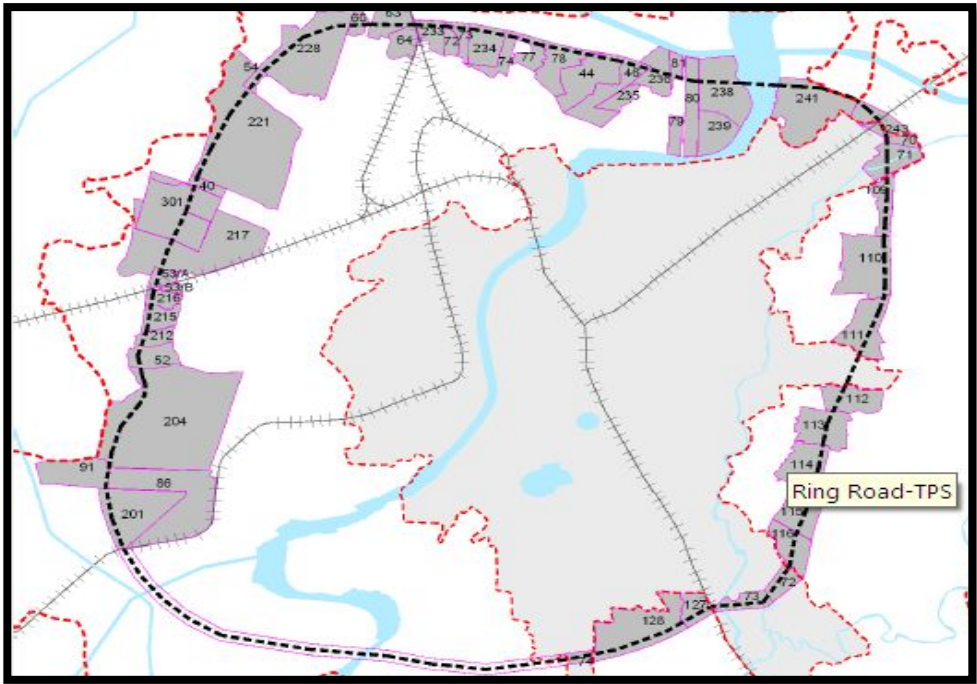

- promote efficient, sustainable & equitable land development
- achieve planned & sustainable growth through Co-operative public participation
- 1126 TPS are in process and about 600 more TPS to be taken up in next 5 years.
- Till Date 100125 Ha of land is planned through TPS.

- Roads & Circulation- 18023
- Weaker Section Housing (Urban Poor) -1202
- School Play Ground, Fire Fighting other social infrastructure- 1051
- Land for Financing of infrastructure- 1802
- Garden open spaces- 1202

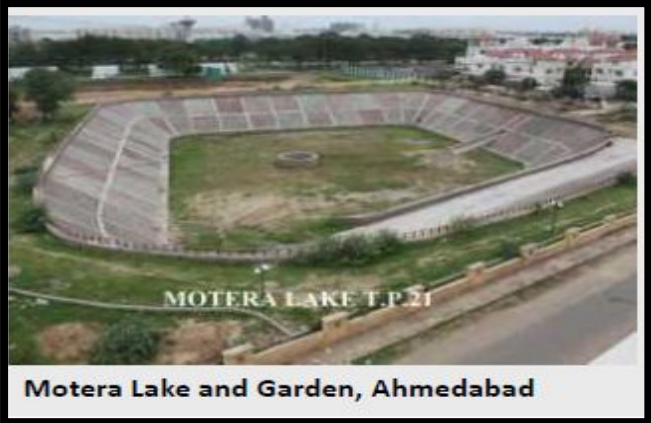

IN CLOSING,

Of total 100125ha , 76845ha is redistributed . And23280 is been used in the above mentioned points.

LAND POOLING IN KATHMANDU VALLEY

- pooling is a technique for managing and financing urban land development
- This technique neither involves land acquisition nor requires huge funds for compensation.
- As it is a self-financing scheme, the project does not have to depend upon the government budget.

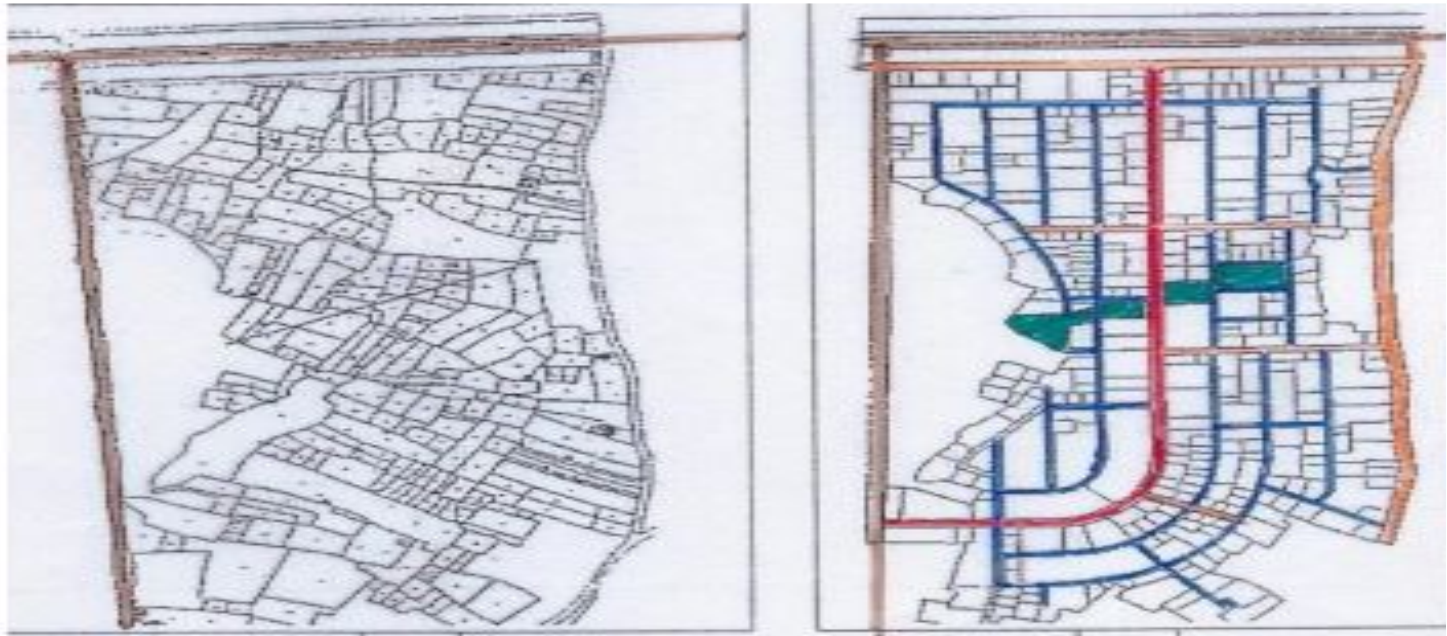

PLANNING AND IMPLEMENTATION PROCESS :

- There exist no land use regulations in the Valley and the use is mixed.
- The building bye laws are the only tool of urban development.
- land pooling was initiated in Kathmandu Valley in 1988.
- Today, a total of 11 land pooling projects have been launched in the Kathmandu Valley. (nayabazar , gopikrishna, lubhu, gongabu .)

GONGABU LAND POOLING PROJECT :

- The Gongabu land pooling project is the first project implemented in Kathmandu valley. It is an example of effective implementation of byelaws for planned residential subzone.

MASTER PLAN OF GONGABU LAND POOLING AREA

Total 406 plots pooled , out of which 346 plots redistributed , 45 plots for sale as service plots , 13 plots for open spaces and public spaces.

LAND POOLING IN **ANDHRA PRADESH** :

Land Pooling Scheme is intended for Land Owners volunteering to offer their land against a guaranteed return of developed and reconstituted plot and other benefits.

Planning principles:

- Fused grid concept
- Plots facing 25 mts and above roads will have service roads for car access
- Higher density plots along the wider roads
- 15.6 mts is the min ROW in residential to accommodate underground utilities and walkways
- Heterogeneous mix of plots in all the communities.

Neighborhood: Each town was divided into 4 equal parts called neighborhoods of 1 km x 1 km size (about 250 acres) with about 25,000 population (7000 households. Primary school, local shopping, work communities etc. will be at walk able distance of 10 mins.)

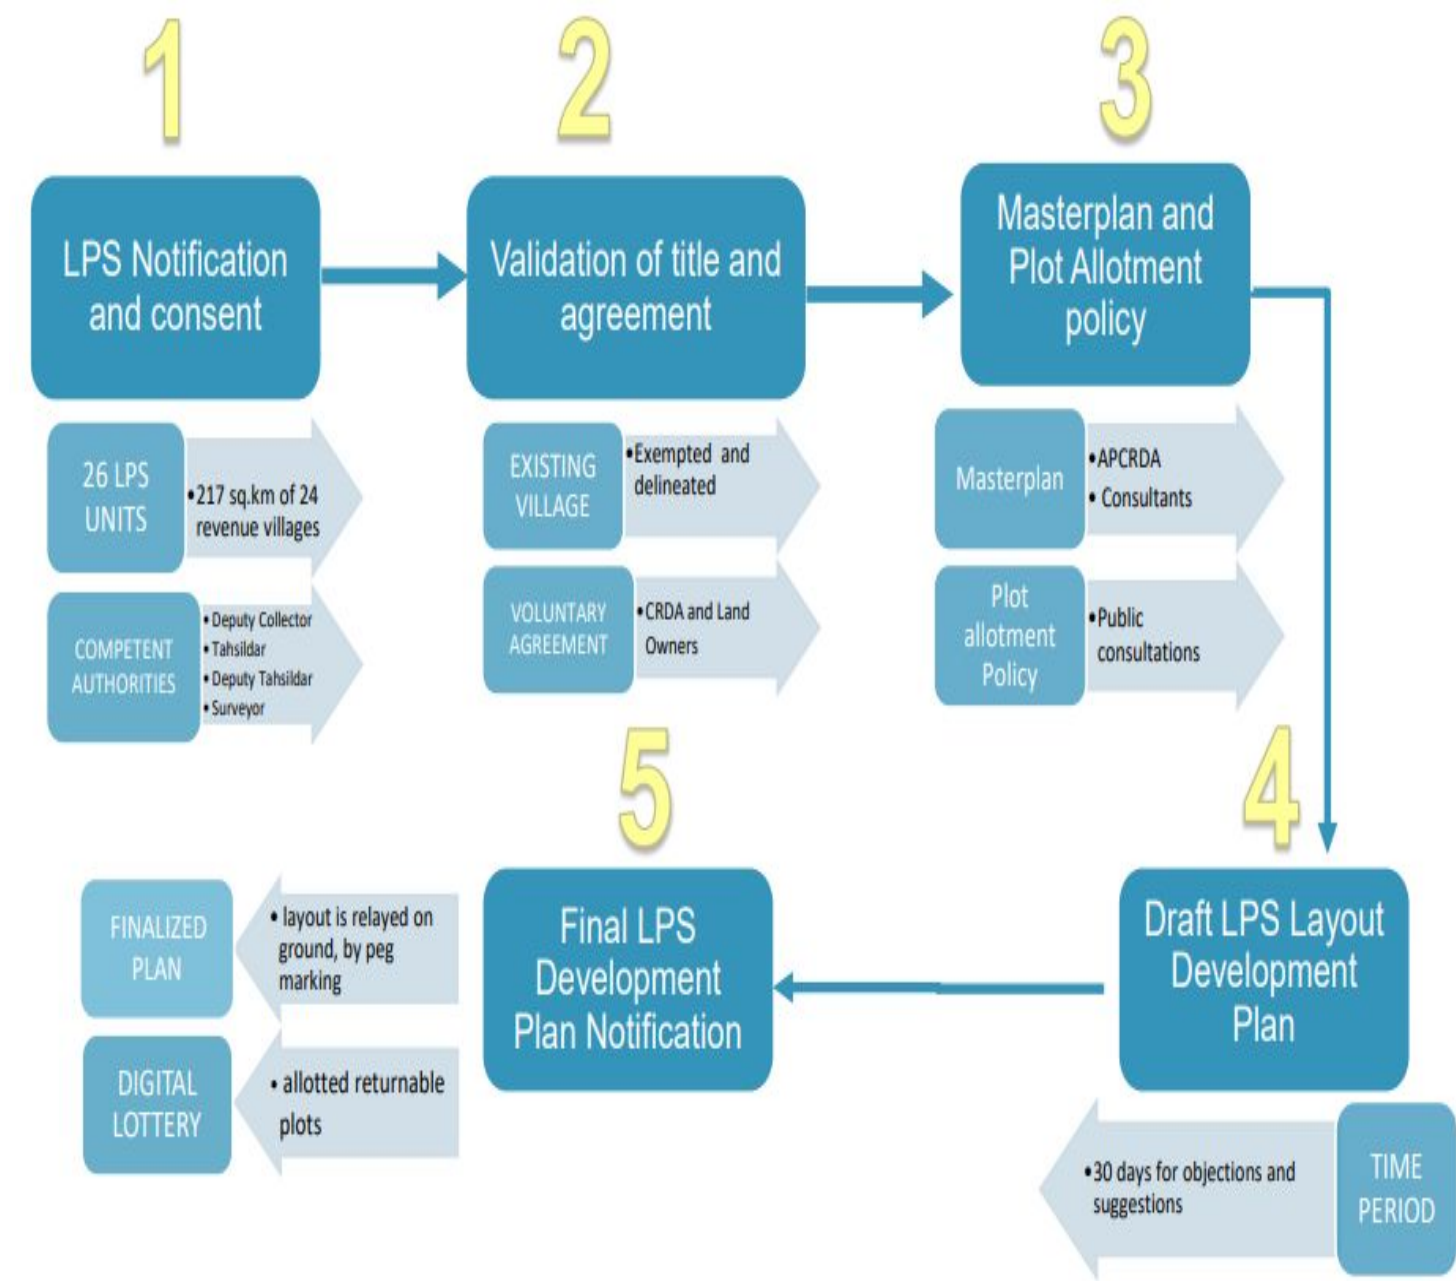

Community: Each neighborhood is divided into four equal parts called communities of ½ km x ½ km size (about 62.5 acres) with about 6000 population (1700 households).

CASE STUDY ON NELAPADU VILLAGE:

- Nelapadu is located in the South Western quarter of the Capital City.
- Nelapadu village being the first village to participate in the LPS and being well responsive to the Land Pooling process, was taken up as the first village for preparation of layout of returnable plots under the Land Pooling Scheme.

Nelapadu Plot Allotment:

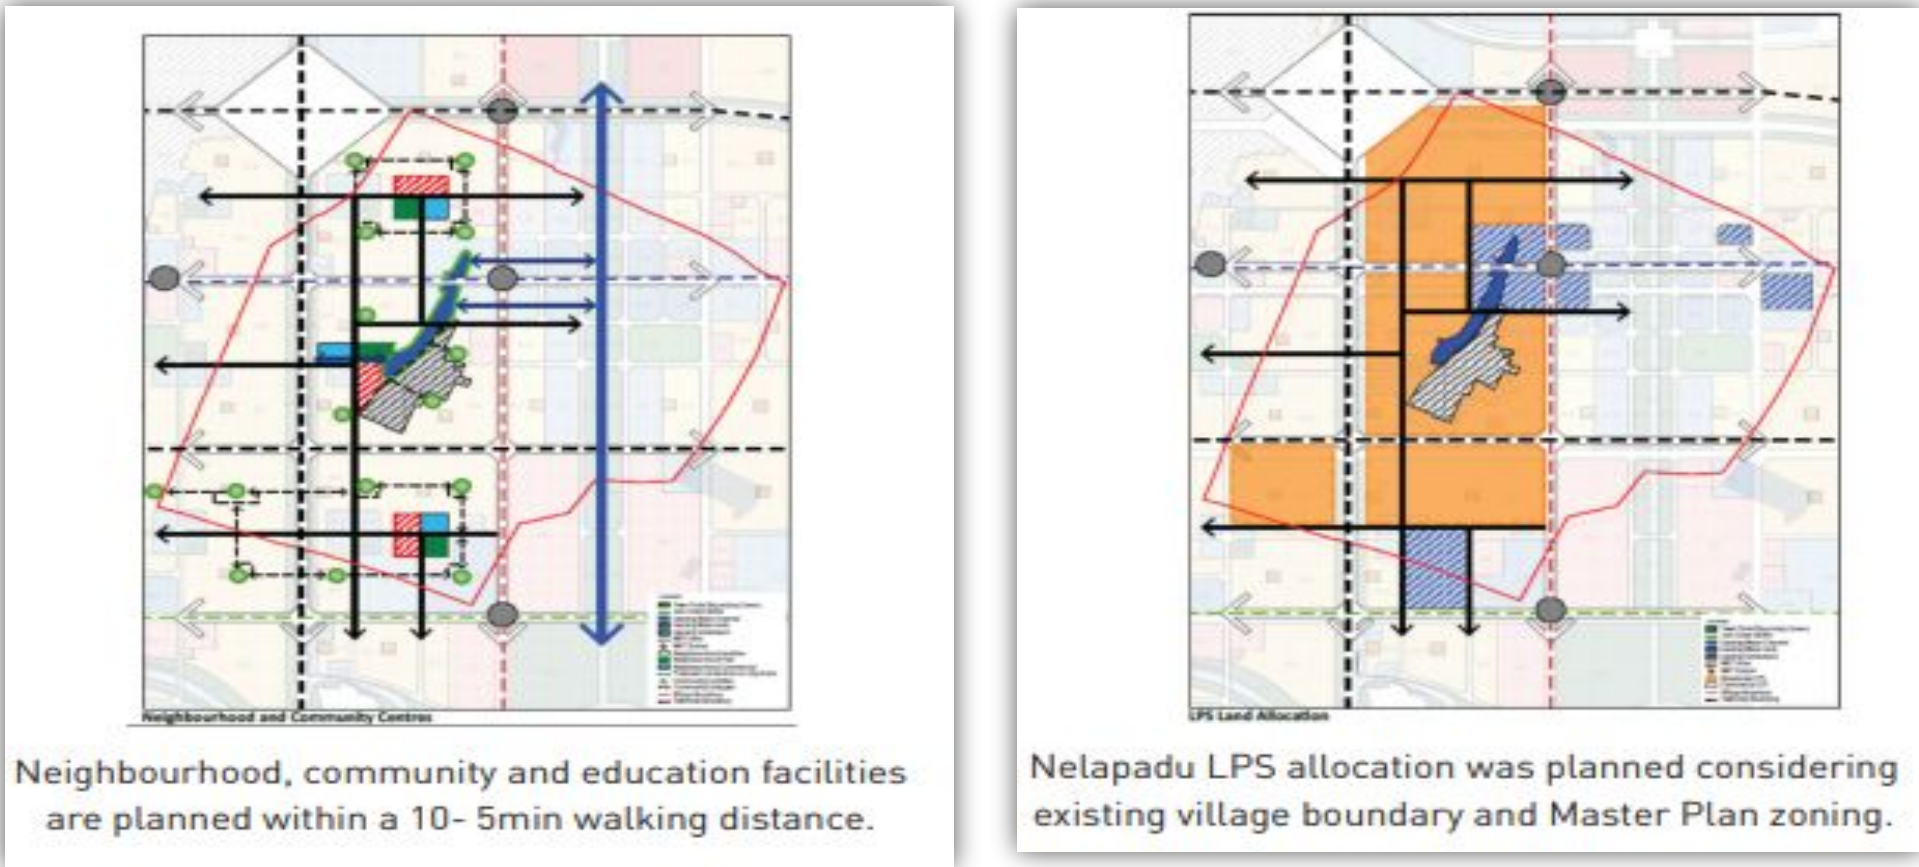

- A Total Number of 981 Land Owners participated in land pooling scheme from Nelapdu and extent of Land Pooled land is **1300.9225 acres.**
- The Total Residential plots sub categories available for selection were 494 and the Nelapadu land owners opted for 118 sub categories.
- The Total Commercial plots sub categories available for selection were 497 and the Nelapadu land owners opted for 64 sub categories.
- Total Residential plotted area :12,93,495 sq.y or 267.25 Acres
- Total Commercial plotted area:3,14,720sq.y or 65.03 Acres.

Farmers demands

- Returnable plots within the same village or nearby villages
- Jareebu returnable plots within jareebu lands
- Plots should orient true north
- No road hits to the plots
- No chamfers to the plots, should be rectangular
- No plots in LA parcels • Vaastu

Township Level Planning Concepts Applied In Nelapadu Layout:

LAND POOLING IN MAHARASHTRA :

Planning Approach For Urban Development in Maharashtra state-

- Bombay Town Planning Act 1915- Earlier planning Approach for preparation of Town Planning Schemes in the areas of development in the city.
- Bombay Town Planning Act 1954- After independence, preparation of Development Plans is made mandatory for each urban local body under its jurisdiction and preparation of the Town Planning Schemes in the areas of development plan in the city.
- Maharashtra Regional and Town Planning Act 1966 – Three tier planning approach was introduced –
 - a. Preparation of Regional Plan to control the development in the areas outside the jurisdiction of the Planning Authority.
 - b. Preparation of Development Plans of the areas under jurisdiction of the Planning Authority
 - c. Preparation of the Town Planning Schemes in the areas of development in the city.

MAGARPATTA CITY:

- Spread over 430 acres (172 ha)
- A city within a city, Magarpatta City is home to a commercial zone, residential neighborhoods, two schools, a multi specialty hospital, a shopping mall, multiple restaurants, a gymkhana and a large 25 acre serene park called Aditi Garden. All this is complemented by a verdant environment and a pollution free ambience
- Magarpatta City has introduced eco-friendly development and has green spaces that make up for 30 per cent of the area.
- Magarpatta city is a township developed by the cooperative movement of farmers In Hadapsar village, Of 123 families of farmers who pooled their land for development. Where each and owner were given equity of share equal to their lands, in terms each share was equivalent to 1sq meter of land and cost ₹100, in1998
- Magarpatta Township holds shares of 51 per cent while 49 per cent is again shared with the land owners, in addition to the revenue model.

GENERAL GUIDELINES :

1. The selected area for land pooling shall be adjoining to a develop4d area , and shall have a proper accessibility.
2. Road width minimum of 12m
3. The selected area shall not fall under any restricted area
4. The criteria for land pooling are :
 - a) Land availability
 - b) Willingness of the owner
 - c) Potentiality of development
5. At least 2/3rd of the land owner shall be willing to take up the land pooling process
6. Categories of land pooling
 - a) area > 20 heacters
 - b) Area should lie between 2- 20 hectares

In the first case the returnable land is 60% , retained land is 40% . in formal case the returnable land is 48% and retained land is 52%
7. High density residential area
8. Authorised area
9. If more than 1/3rd of the land owners of the area are not willing to join the scheme then the scheme shall be withdrawn .

SITE SELECTION CRITERIA : The study area has been finalized considering the Central zone which has been taken into account for the selection of site , as it's the core of the city and has more need for redevelopment (Circle 3,4,5 of GHMC). considering the below mentioned criteria's, which have been sub divided into macro and micro. We have considered 6 criteria's under macro level , and 5 criteria's under micro level as mentioned below.

MACRO LEVEL:

- Population of ward
- Area of ward
- Density of ward
- Land use
- Road density
- Network pattern

MICRO LEVEL:

- Slum population
- No. of slums
- Ward area
- Road density
- Basic infrastructure

DELPHI technique was used to sort areas from macro level to micro level . Firstly , Weightage for each criteria was given (by professors)

Each criteria has been allotted score based on the standards . Secondly , the weights and scores are multiplied for each criteria for each an every individual ward. Then, sum of all the multiplied values of all criteria's of every individual ward have been done. Finally, average has been calculated on dividing the values by the no.of criteria's considered.

From the above mentioned process, wards have been sorted for further micro level analysis.

□ **The desirable wards according to the above analysis are:** Borabanda , Jambagh , Manghalhat , Rahamath Nagar and karwan

ward no.	ward name	no. slums	scoring	oring*weightag	slum populat	scoring	oring*weightag	area	scoring	scoring*weightage	road density					scoring	weightage*scoring	basic infrastructure	scoring	weightage*scoring			
			for the area to be developed should have more number of slums score1- 10-20 score2- 20-30 score3- 30 and above	the average weight allotted is 1		higher the population , higher the probability for land pooling score1- 10k and below score2- 10k-20k score3- 20k and above	the average weight allotted is 2		larger the area , more the number of residents . Need for development is high score1-lowest -1 score2- 1,000-1,200 score3- 1,200 and above	the average weight allotted to area is 5	150ft	120ft	100ft	80ft	60ft	total density	lower the road density , higher the congestion and higher will be the probability for landpooling score3- lowest to 0.2 score2- 0.2-0.4 score1- 0.4 and above	the average weight allotes is 3	accessibility to social infrastructure(schools, hospitals, bus stops , collages , state buildings)	lesser the accessibility more the probability for landpooling	the average weight allotted is 4	total of weights* scoring	avg of total =total/5

- ✓ POPULATION DENSITY OF THE AREA: 30398.47046 per sqkm

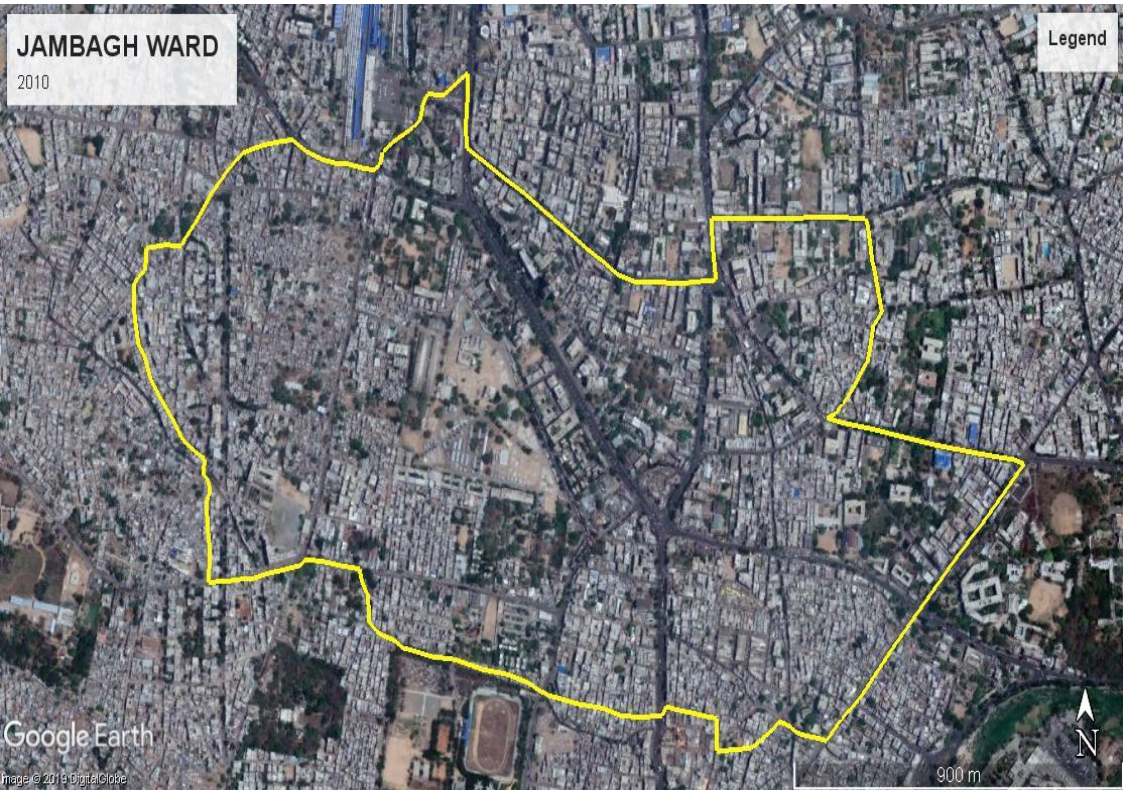

TIMELINE:

From the images taken from google earth we can observe that the area jam Bagh is located nearby CBD area which is connected well by good network of roads since 2003. most of the study area is built up area with very less open spaces as it is located near by the CBD which gives the area special importance. The study area mainly constitutes of mixed land use , where in the year 2019 metro rail project has been started for better accessibility.

- SURROUNDING AREAS: NORTH: Gunfoundry , SOUTH: Begum Bazar , EAST: Gowliguda , WEST: Nampally
- ACCESSIBILITY: RTC busses, auto rickshaws, and Osmania medical college metro station
- HISTORY OF JAMBAGH: The area Jam Bagh has acquired its name from the fruit jam(guava) as the whole area was guava farm during the time of nizams. The area is famous for fruit and flower market which is famous since decades

In the year 2003 , most of the local streets were kutcha roads . Encroachments were less . The strain on the infrastructure was very less. Density of population was comparatively less

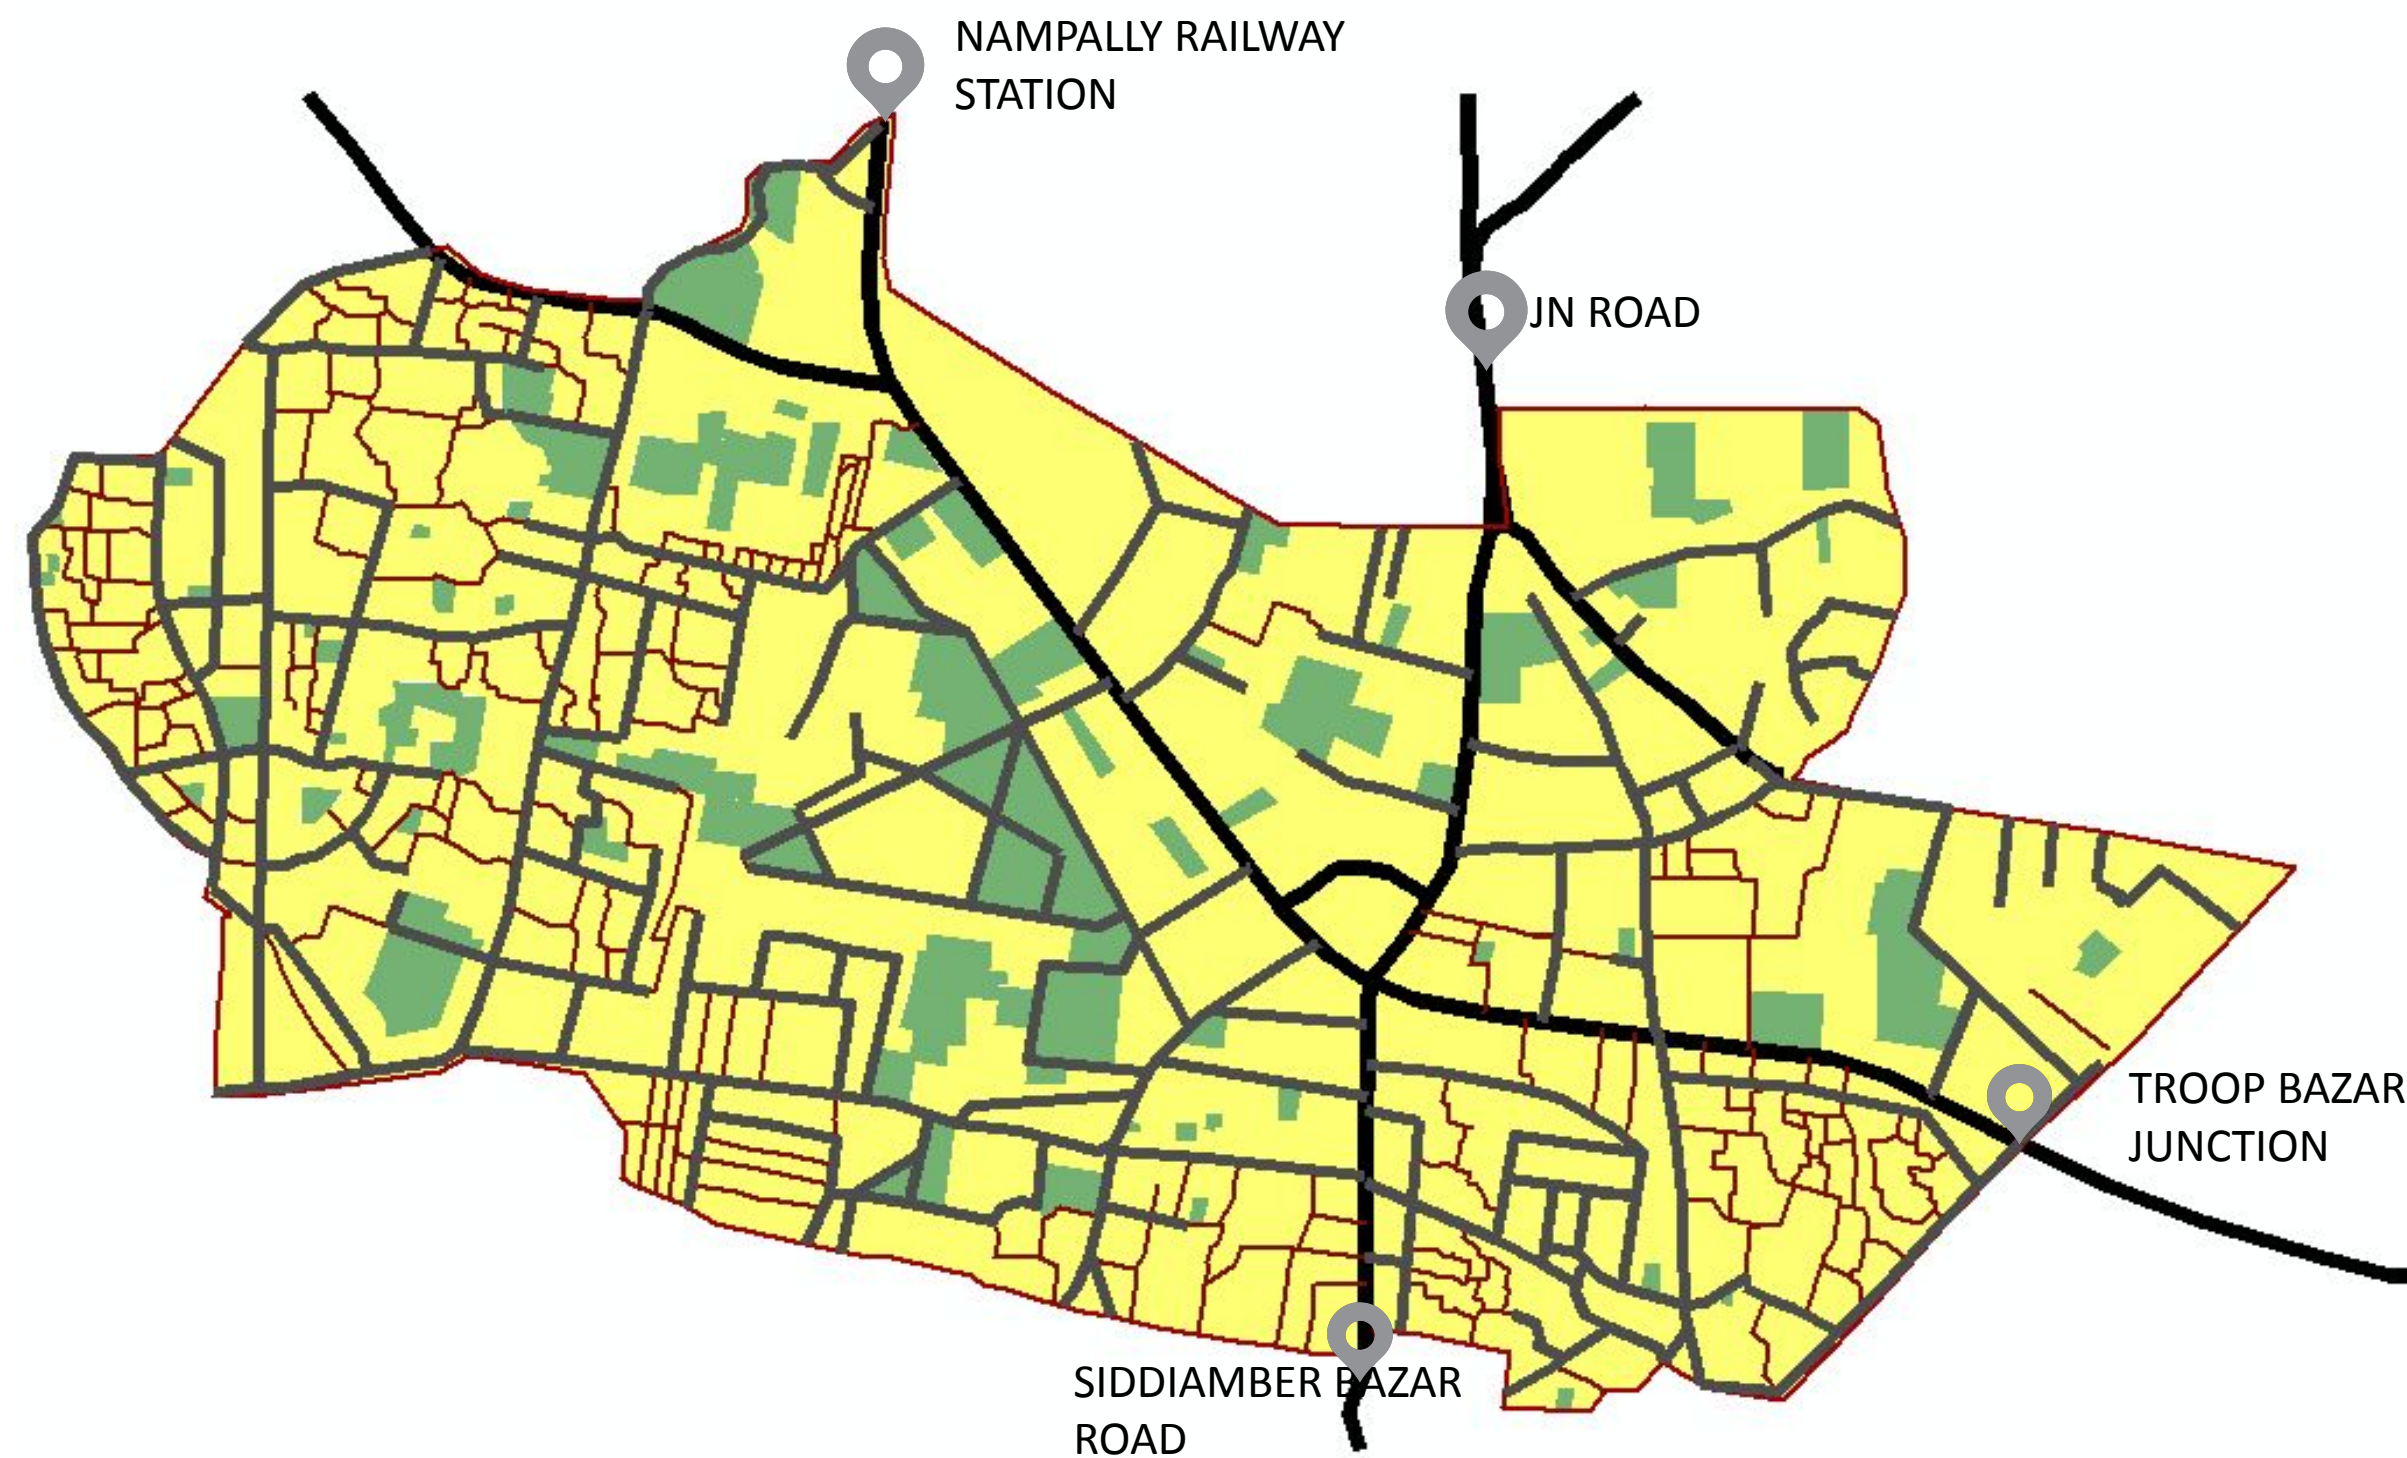

In the year 2010 , all streets were CC . Encroachments increased rapidly . The strain on the infrastructure started increasing. It turned to be a major CBD area . The percentage of commercial activities increased rapidly which lead to traffic congestion on the major arterial roads

In the year 2019 , the percentage of open land reduced . The strain on the infrastructure was still a problem. Metro rail project came up , leading to many communal problems .

THEMATIC MAP (BASED ON LAND VALUES of the ward)

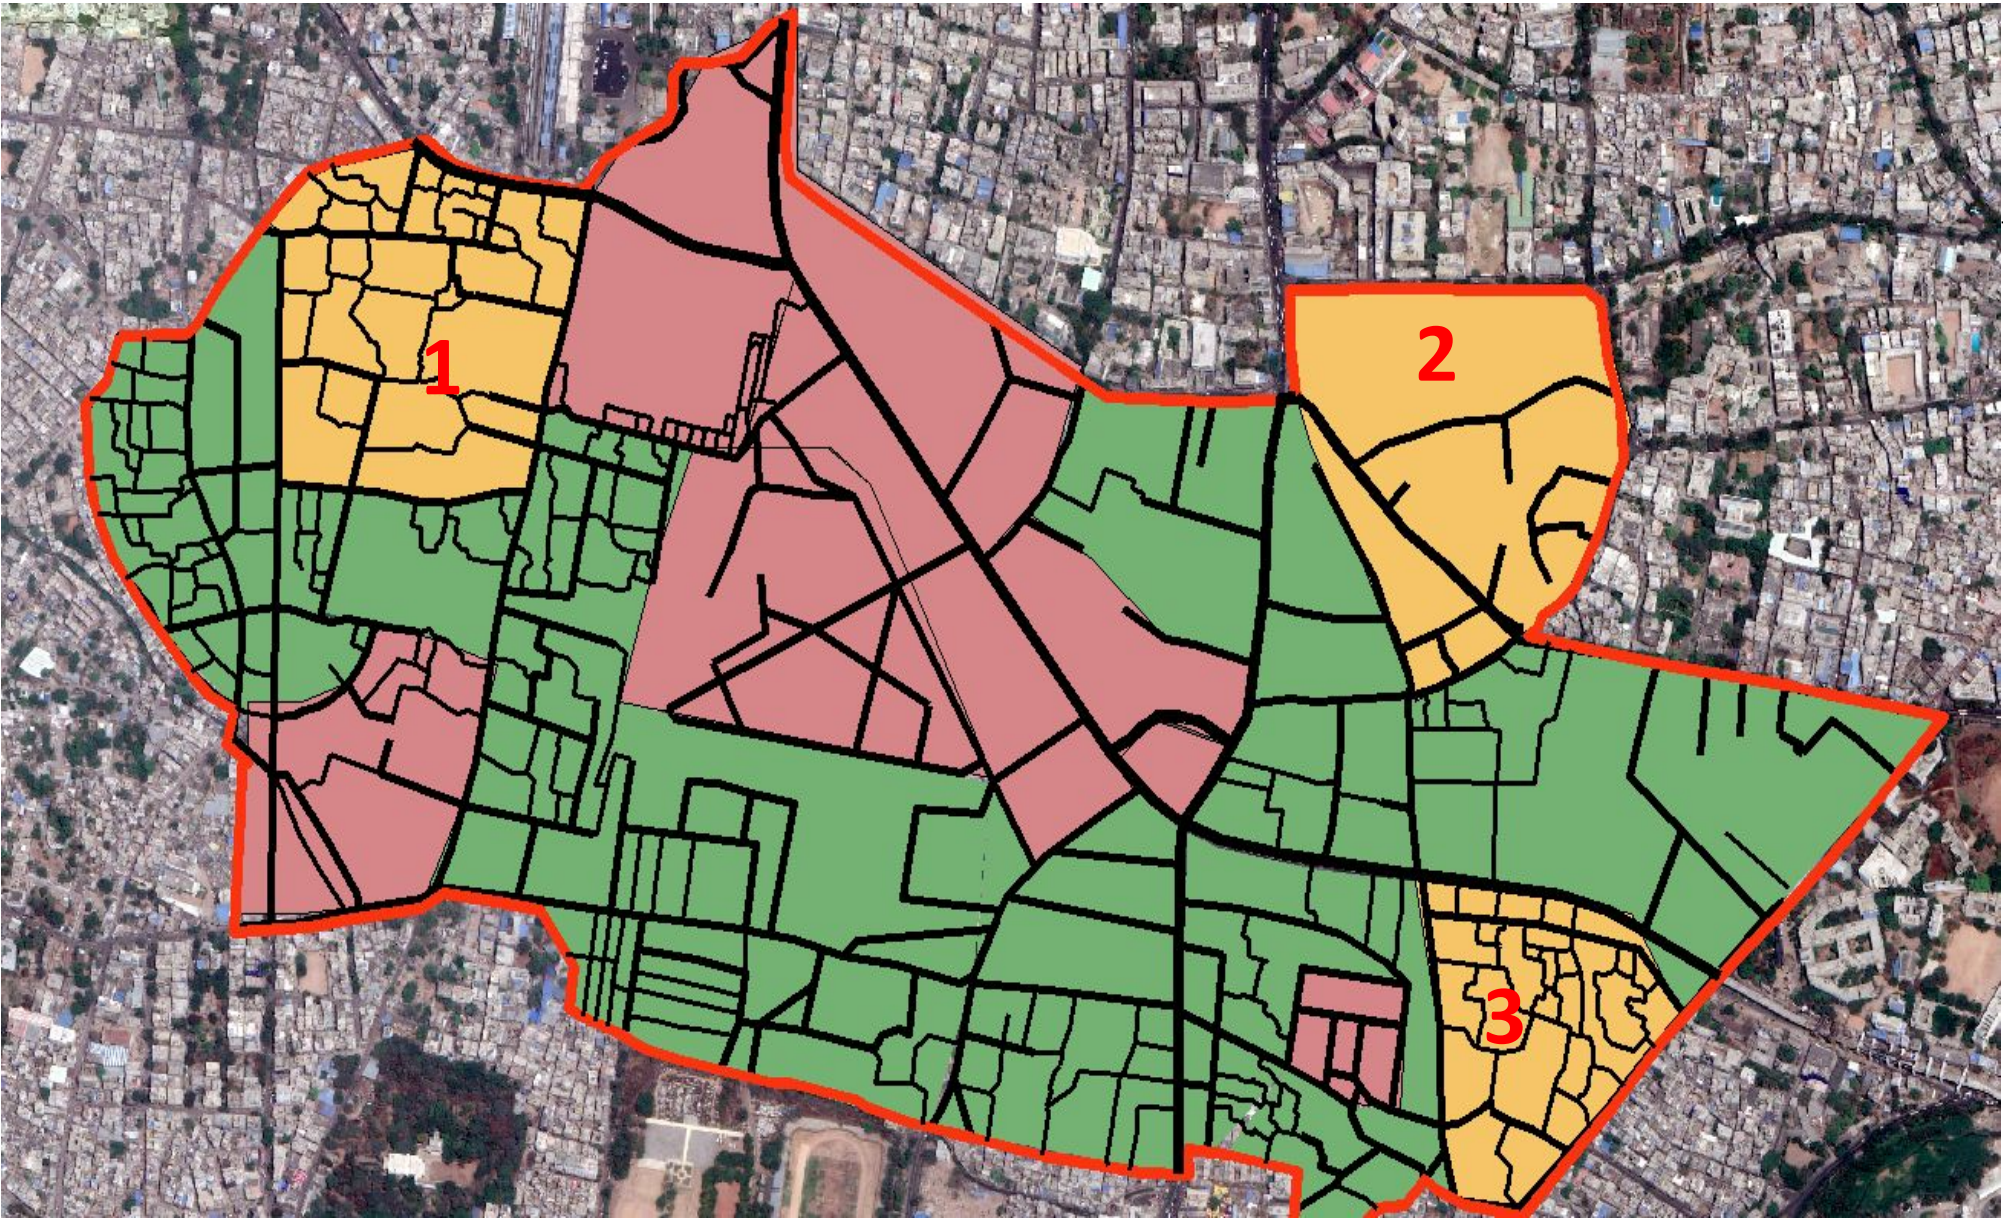

- 18K–22K (JN ROAD, ABIDS, HANUMAN TEKDI)
- 15K-19K(MALLEPALLY, JAMBAGH, MJ MARKET RD)
- 12K-15K (GOSHAMAHAL,RAM KOTI, AZIZBAGH, CHANDANWADI)
- 8K-11K , MOSTLY 10K (AGHAPUR , NAMPALLY)

THE LAND VALUES IN BHARAT NAGAR ARE COMPARETIVELY LOW BECAUSE OF LACK OF INFRASTRUCTURE FACILITIES , CONGESTION ISSUES , DENSITY OF POPULATION .

PRELIMINARY FINDINGS:

- The areas marked with green are preferably organised . Generally the layout of housing is satisfied .
- The areas marked in pink are basically the semi public and public spaces , heritage buildings with an exhibition ground .
- The areas marked in yellow are comparatively unorganised . The need for development is high and the layout pattern is also organic with crammed houses, Violating the development control regulations..

Organised; Organic; Public spaces, historic buildings

LIVABILITY SURVEY:

After analysing the base map and the land use map of jam Bagh ward , we have demarked three areas, To carry out further detailed study . Considering 5 criteria’s, i.e., the accessibility , layout pattern, need for development, land-use and liveability index.

ACCESSIBILITY: Accessibility is usually estimated by means of infrastructure based measures, which describes the performance of the road network, transportation and communication

LAYOUT PATTERN : layout is a geographical localize community

Check list: organic pattern, semi organic patter and grid pattern.

LAND USE : it is the function that humans apply to the land available to them

Check list : Activity happening , Density (no.of floors), Age of buildings, Developed area

NEED FOR DEVELOPMENT

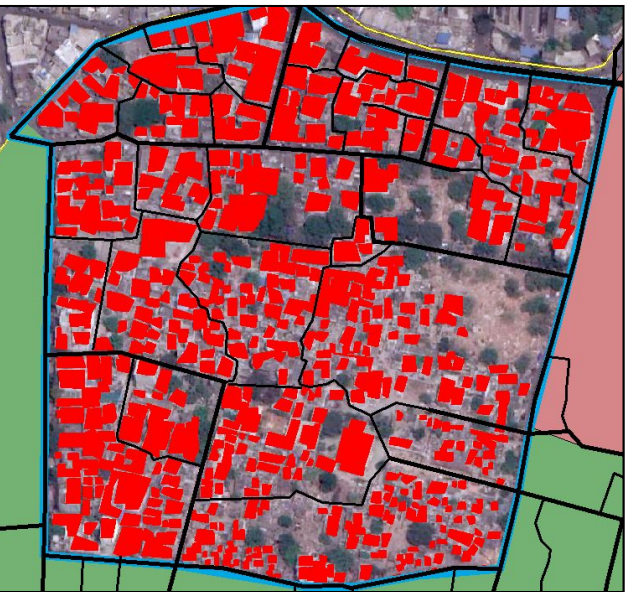

CONCEPT OF LIVIBILITY:

The concept of livability: it assesses which locations around the particular area provide the best or the worst living conditions.

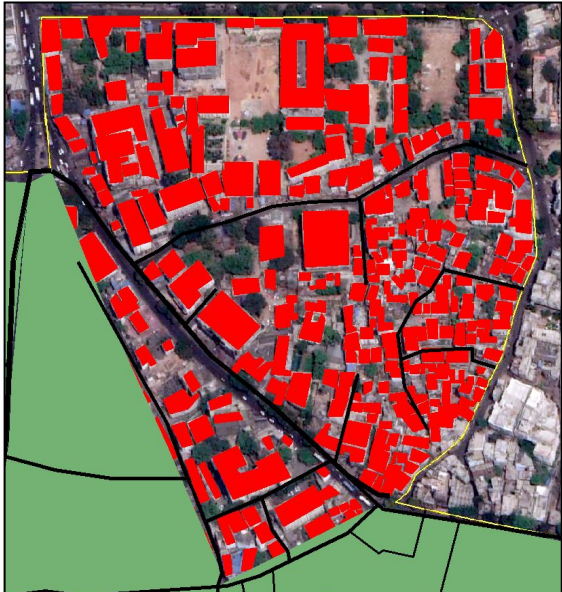

Each area is assigned a score for qualitative and quantitative factors across five broad categories of Stability, Healthcare, Culture and environment, Education and Infrastructure.

The factors people take into account include:

- safety and health related issues (for example, personal security, public health, traffic safety)
- local environmental conditions (for example, cleanliness, noise, dust, air and water quality)
- the quality of social interactions (for example, community identity and pride, neighborliness)
- opportunities for recreation and entertainment
- aesthetics
- existence of unique cultural environmental characteristics (example, historic structures, mature trees, traditional architectural styles, streetscapes).

From the criteria’s considered and analysing the selected 3 areas for further study , the finial area selected for land pooling is **BHARTH NAGAR**, Nampally. JAMBAGH WARD.
□ Where, BHARATH NAGAR, NAMPALLY; the area is of 39 acres, with unorganised settlements in organic pattern with worst liveability index where there is a need for development.

As the analysis indicates, there is much need for development and management of the facilities in the Bharath nagar area compared to the other two areas according to the requirements.

Whereas rest of the two areas considered, HANUMAN TEKDI JAMBAGH, were having satisfiable requirements compared with Bharath nagar.

Where The main aim is to develop the sustainable living conditions for the considered neighborhood with proper connectivity, infrastructure facilities and equitable land distribution which help reduce the congestion and meet the basic requirements of the people, benefited by the facilities provided to them.

JUSTIFICATION :FOR AREA SELECTED

GUIDELINES

ACCESS STREET WIDTH

AREA

POPULATION

SOCIAL INFRASTRUCTURE

MINIMUM UNIT SIZE

SPORTS FACILITY

OPEN / RECREATION SPACES

The width of access street can range from 6-15m With a design speed of 15kmph

The area of a neighbourhood should be from ½ sq.mile to 1sq. mile (1 sq mile = 2.589sqkm)

The population of a neighbourhood can range from 1,200 – 10,000 Or 800-1000 HH

A pre-primary school for 2500 [population , primary school for 5000 population, secondary school for 7500 population. Community room for every 5000 population ,

The minimum dwelling size of 1BHK is 60-80sqm For 2BHK IS 80-120sqm For 3BHK it is 120-160sqm

Residential unit play area for 5000 population it should be 5000sqm

1. Recreation space

2. Organized green

3. Common spaces (vacant land , forest cover)

3sqm per person is minimum norm

OBSERVATIONS:

- The road width of jambagh ranges from 2-8m . Most of those are 2,4 meters .
- Area of bharat nagar is 39 acres
- POPULATION: ranges from 4000 to 4600
- SOCIAL INFRASTRUCTURE: 3 hospitals , 2 schools .
- MINIMUM UNIT SIZE: 67 sqm for 1BHK 84 sqm for 2BHK
- SPORTS FACILITY: no playgrounds are provided in the area
- OPEN/ RECREATIONAL SPACES: open spaces are being used as dumpyards .

INTRODUCTION TO BHARAT NAGAR :

STUDY AREA :, BHARATH NAGAR, Aghapura , Nampally Dargah road Nampally.
WARD : Jambagh
ELEVATION : 494 Meters

BASE MAP OF BHARAT NAGAR

The base map of the study area depicts: Most of the area is built up area i.e., 80% Very few percent of land is left for open spaces, i.e., 5% (approximately)

LAYOUT MAP OF BHARAT NAGAR

The layout of the study area depicts: Irregular settlements where the connectivity is acceptable .

LANDUSE MAP OF BHARAT NAGAR

The land use map of the study area depicts:

- Residential land use of 51%
- Commercial land use of 20%
- Institutional 1%
- Mixed 13%
- Transportation and communication – 7%
- Open spaces – 5 %

ANALYSIS OF THE PIOLET SURVEY(10):

As our study focuses on developing the study area BHARATH NAGAR with proper infrastructure facilities, efficient layout patterns with sustainable & equitable land development. we have conducted a survey, where it indicates

OWNERSHIP STATUS AND FINANCIAL CHARACTERISTUCS OF THE STUDY AREA:

OWNERSHIP STATUS

- 80% of the people own their own houses with plot area ranging from 80-150 yards where most of the houses age above 10 years with 1&2BHK’s per dwelling.
- Land value ranging between 15lakhs-20 lakhs for 1BHK and 25-30 lakhs for 2BHK.
- Where the rents paid for 1BHK ranging from 3000-4000 and for 2BHK 5000 and above.

SOCIAL CHARACTERISTICS OF THE STUDY AREA:

HEALTH AND HYGINE: the area has many polyclinics centres within the neighbourhood and 2 hospitals which are within a distance of 1-2kms from most of the households

- SAFETY AND SECURITY: most of the people of the area have mentioned that they have not faced any crime in the recent years and they feel safe in their neighbourhood where they have their relatives within the neighbourhood and interact daily with each other
- SOCIAL INTERACTIONS: people of the study area have stated that they interact well with each other in their daily life and during festivals without any issues and differences between them.

ENVIRONMENTAL CHARACTERISTICS OF THE STUDY AREA:

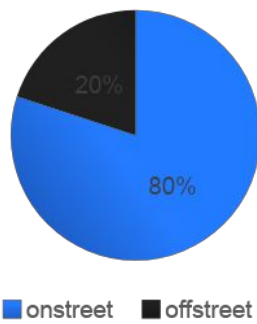

the study area is not provided with parks with bad aesthetic conditions. Where the children of the neighbourhood use the open spaces near the dargah area as playgrounds. The area is provided with street lights and streetscaping maintained in bad conditions.

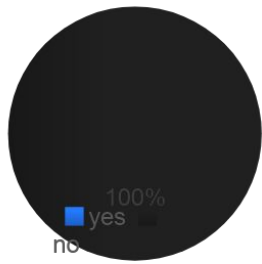

FINALLY , it indicates that area is connected well with BT roads for the arterial roads and CC roads for the local streets of the width of 2meters not maintained properly and 80% of the people own their own houses with plot area ranging from 80-150 yards where most of the houses age is above 10 years with1&2BHK , and with 80% on-street paring and no pedestrian facilities provided. The area is provided with no parks , schools within a distance of 2kms, health care centres within a distance of 1-2kms. There is no proper solid waste management in the area with no door-to door facilities and few dump yards, and water supply every alternate day.

PHYSICAL CHARACTERISTUCS OF THE STUDY AREA:

PARKING

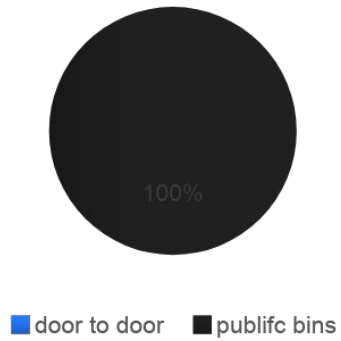

PEDESTRIAN WALKWAY

as most of them had independent houses, parking facilities were lagging in the area. 80% on-street paring is observed in the area and there is no pedestrian facilities provided

- ROADS AND TRANSPORT: the area is connected well with BT roads for the arterial roads and CC roads for the local streets of the width of 2meters which are not maintained properly
- SOLID WASTE MANAGEMENT: There is no proper solid waste management in the area with no door-to door collection facilities and with very few dump yards,

ANALYSIS OF THE SAMPLE SURVEY :

After analysing the results of piolet survey , the final area for land pooling was finalized . And a sample survey was conducted in Bharath nagar , with an area of 39 acres of population ranging from 3000 to 4000.

Land ownership and financial characteristics :

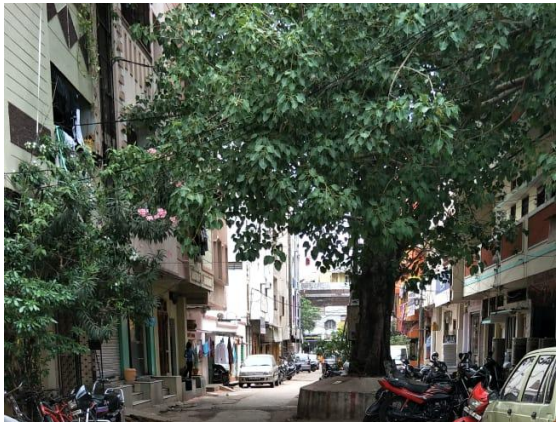

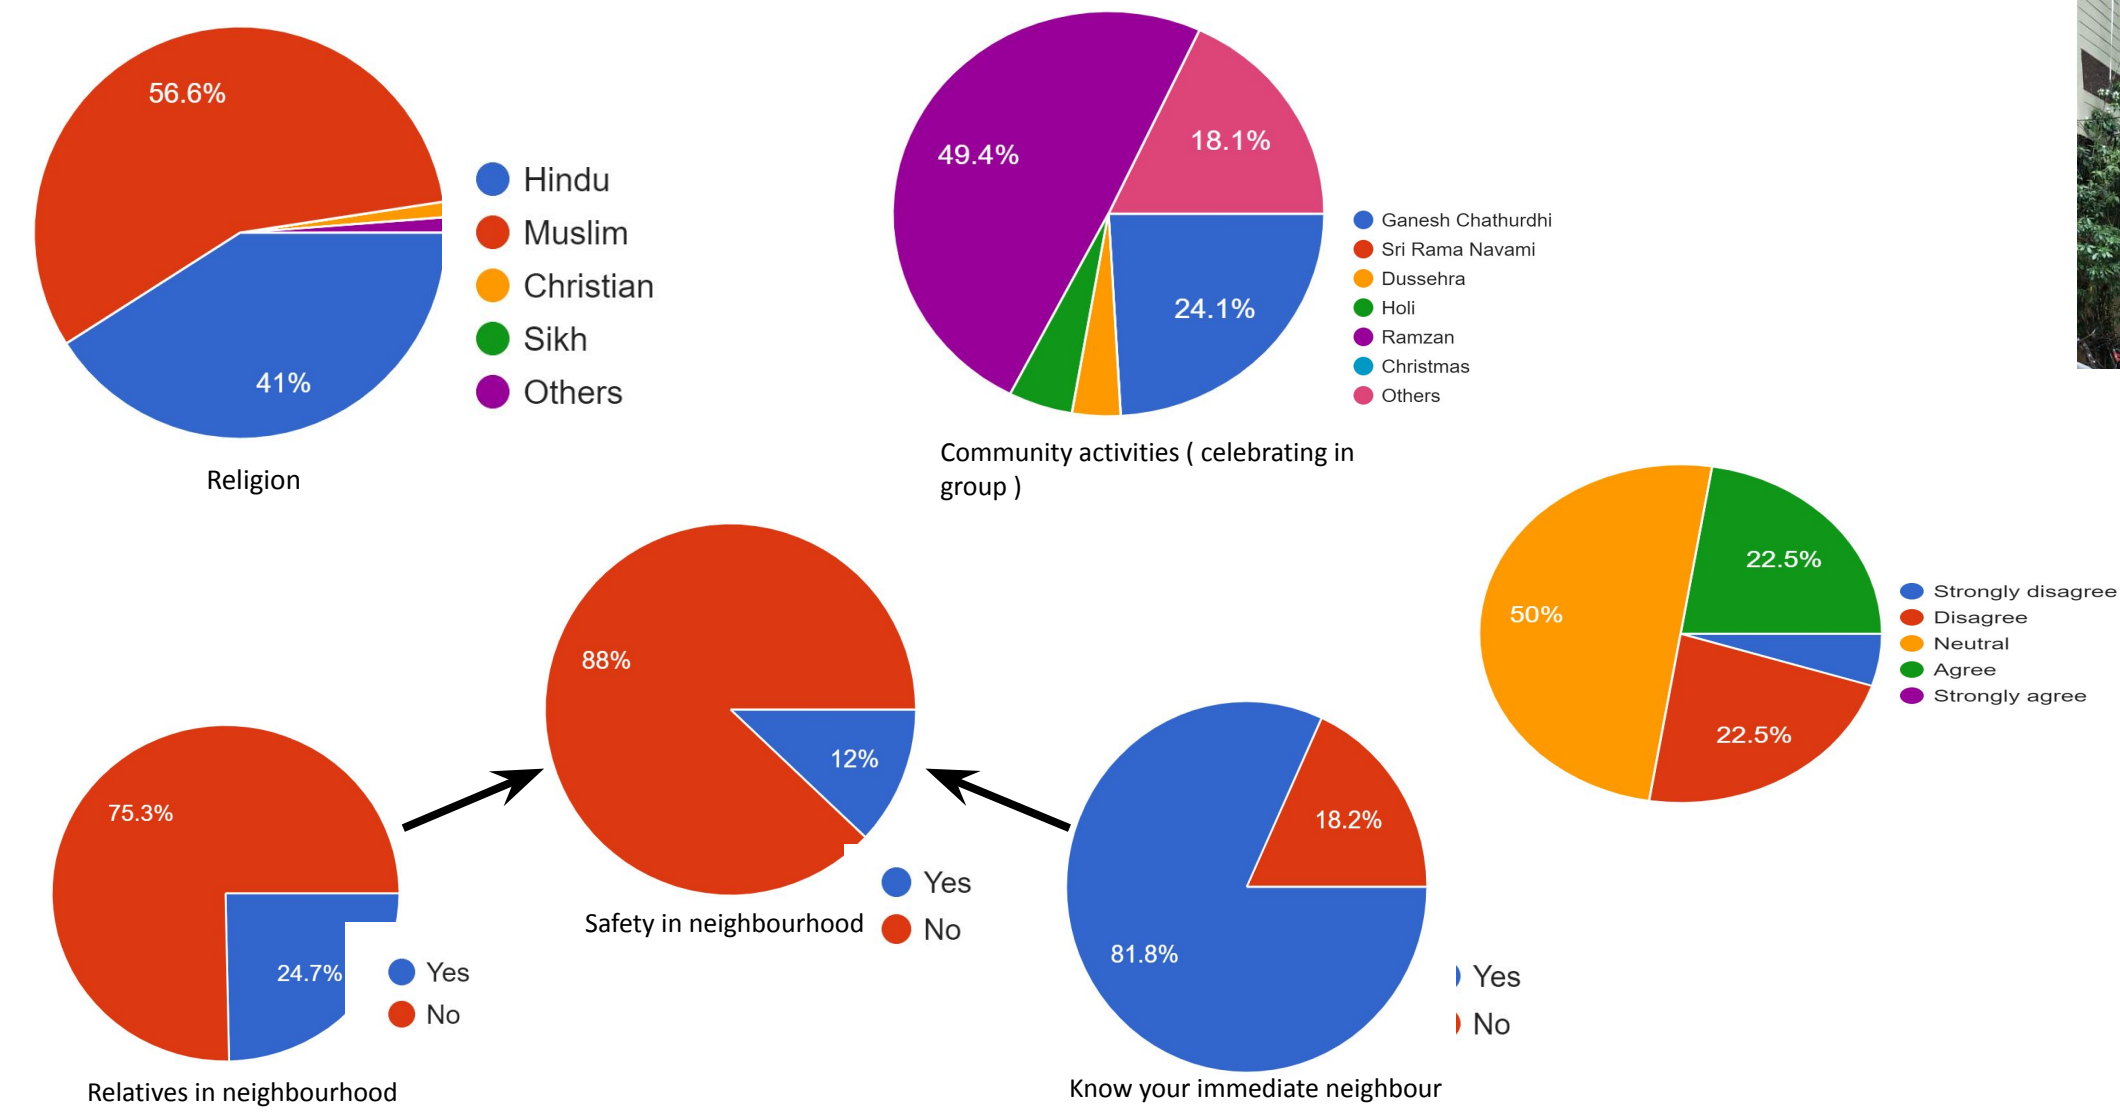

21.7% semi pucca

77% of the houses are pucca houses

Social Characteristics :

The 2 famous religious mosques of the neighbourhood.

Physical Characteristics :

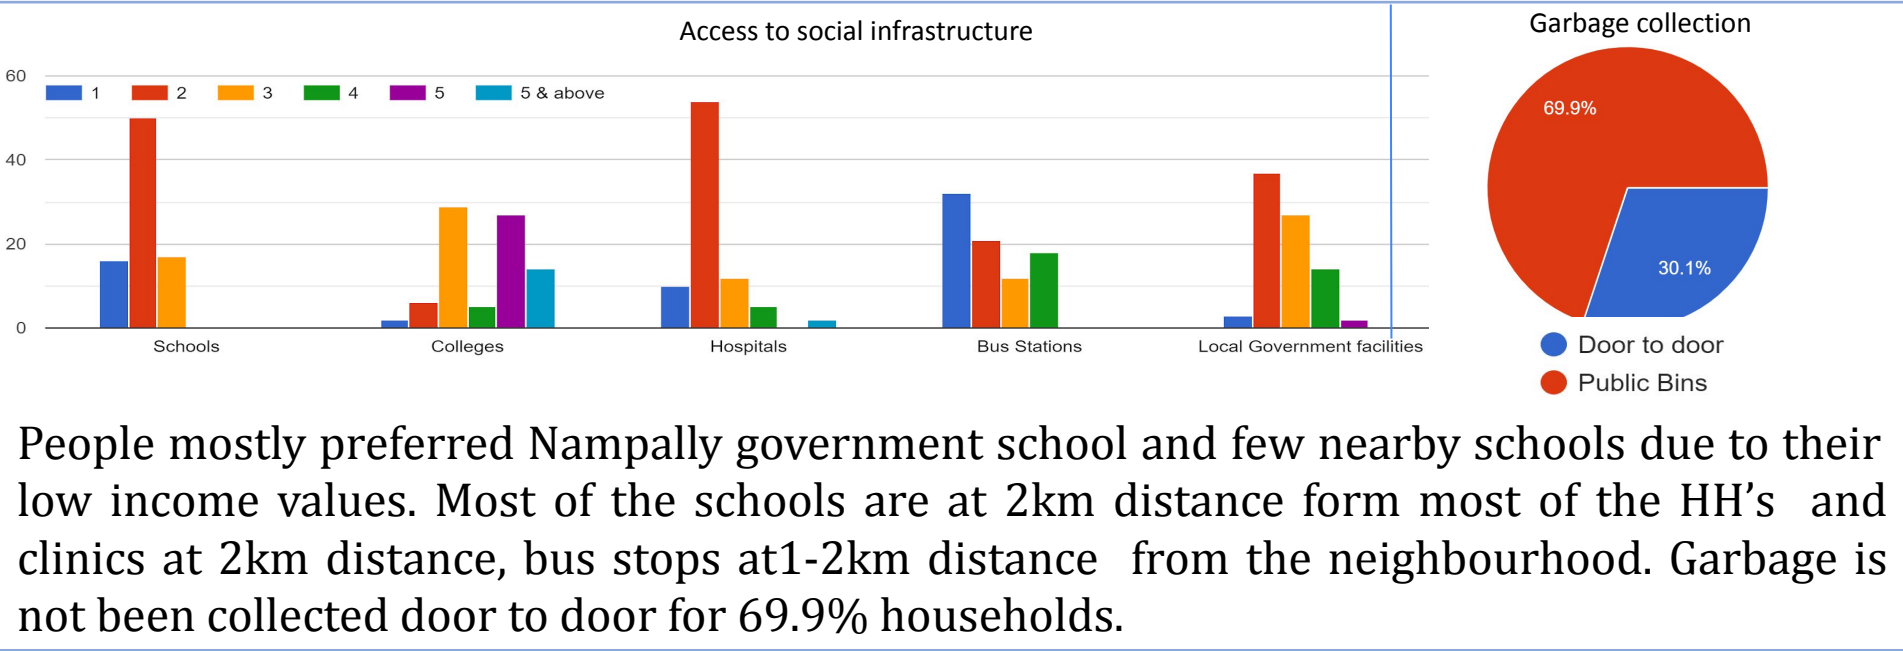

The roads of the local streets are of 2m wide, and up to 12m for the connecting roads. All the arterial roads are of BT i.e., 38.6% and the local streets of CC i.e., 66.3% Roads are maintained by the local government occasionally(during the elections). The streets are maintained by the households itself .73% of the people own 2wheelers, 10.8% 3wheelers(most of them were auto drivers), 10.8% 4wheelers. and park them Infront of their houses. Parking facilities aren't provided . 94% people were practicing on-street parking. Mode of transport used is (private and public) based on their destination

PROBLEMS/ CONSTRAINS OF THE PEOPLE LIVING IN THE STUDY AREA:

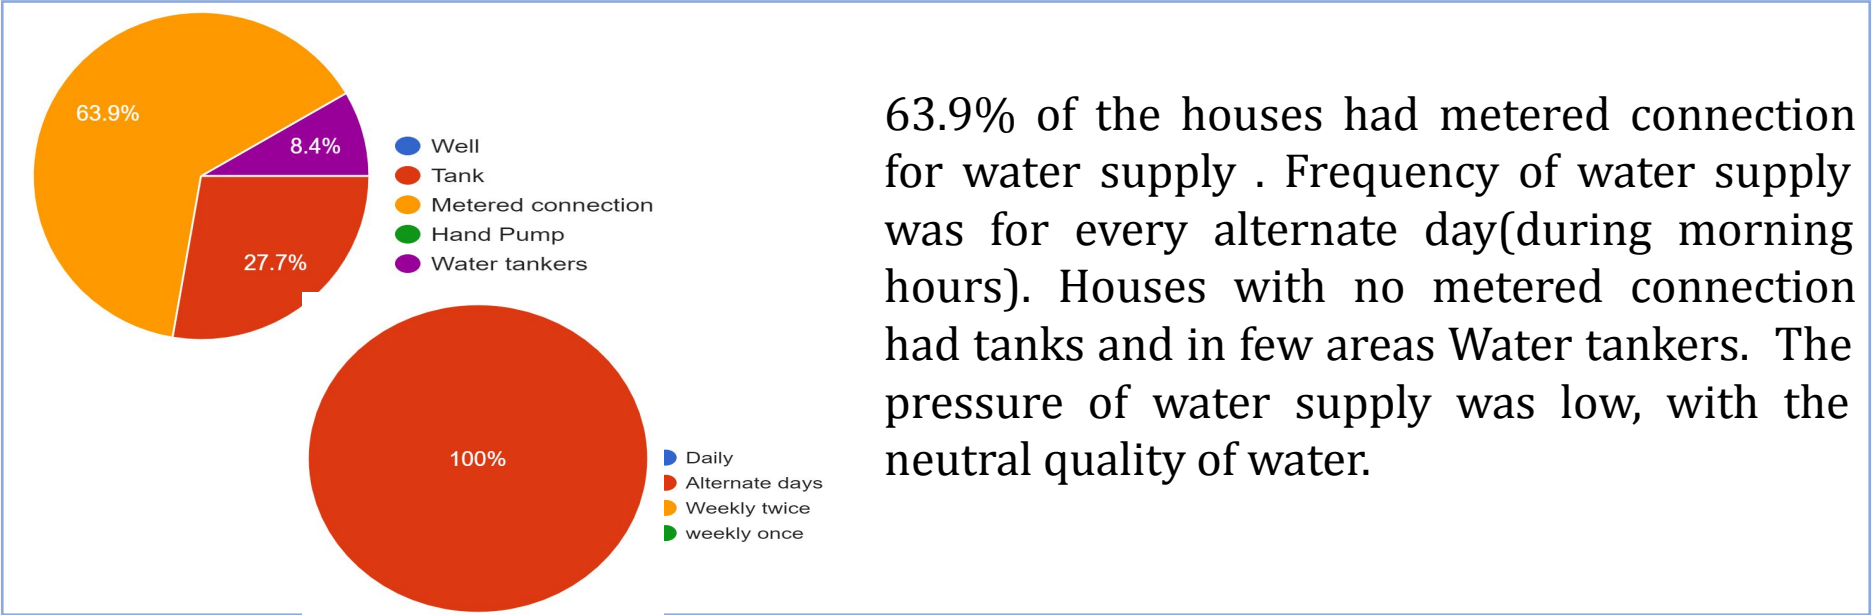

- The people of the area mentioned that:
- There are no proper roads, or the maintenance of the roads by the local authorities.
 - No proper solid waste management, sewerage treatment was practiced in the area.

FINDINGS OF THE SURVEY:

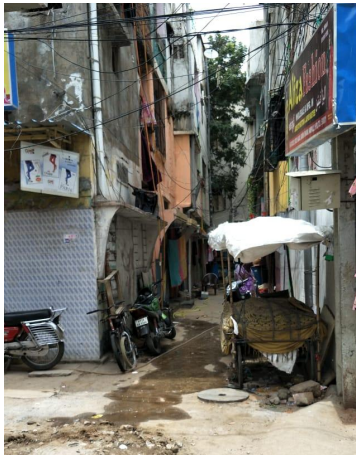

- As the area was near to CBD there was congestion in the area with high population density.
- The area is unorganised without any proper patterns of the layout.
- we have noted that the connectivity of the area is good but is not with proper roads and maintenance of the roads.
- There are no footpath's or pedestrian walkways
- Dwellings had no proper setbacks; few buildings without setbacks where most of the buildings were constructed partially on to the road. Without following any regulations.
- Most of the houses had no proper parking facilities and so most of the vehicles were parked on the road and the area was not provided with proper on street parking facilities for their residents
- There were no parks or playgrounds/ play areas for kids to play and no street furniture or streetscape was observed.
- There was no proper disposal of garbage though their was provision of bins
- no community hall was provided for their community meetings/ gatherings. Or for cultural gathering purposes.
- Unhygienic living conditions , mainly due to lack of solid waste management.
- Accessibility to social infrastructure is appreciable , being a CBD area .
- Interactions with their neighbours , community environment was also appreciable.
- Maximum of the area lacked street furniture

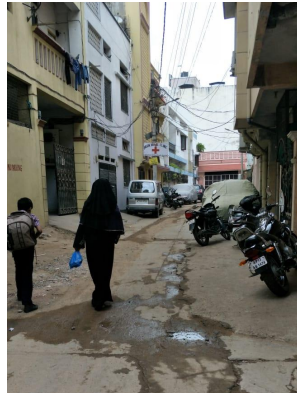

People mostly preferred Nampally government school and few nearby schools due to their low income values. Most of the schools are at 2km distance form most of the HH's and clinics at 2km distance, bus stops at1-2km distance from the neighbourhood. Garbage is not been collected door to door for 69.9% households.

63.9% of the houses had metered connection for water supply . Frequency of water supply was for every alternate day(during morning hours). Houses with no metered connection had tanks and in few areas Water tankers. The pressure of water supply was low, with the neutral quality of water.

Congestion in the area

Unhygienic living conditions

Improper solid waste management

No parking facilities and pedestrian walkways

Connectivity of the roads but not maintained properly

No proper maintenance of drains

CONCEPT OF GENTRIFICATION

Gentrification is a broad framework concept. “It is the transformation of a working-class or vacant area of the central city to a middle class residential and/or commercial use”.
The transformation of neighborhoods from low value to high value.
during the process, the price of units in the affected areas, rehabilitated or not, increases sharply. Such neighborhoods transition process typically involves some degree of transformation of tenure, letting the occupying property.”
“Gentrification is happening on a more massive scale in shanghai or Mumbai .
despite some significant successes, the new ideology was also selective and has generated new problems of social justice

THEORIES OF CAUSES ‘GENTRIFICATION’ :

There are two main theories of which explains the causes of gentrification

- 1. production side theory
- 2. consumption side theory.

	Production side theory	Consumption side theory
CAUSES OF GENTRIFICATION	Gentrification is the result of capital movement Rent gap is key factor for gentrification which means the disparity between the potential ground rent and actual ground rent Gentrification occurs when the gap is wide enough that developers can purchase the land cheaply; can pay for construction, rehabilitation, can pay interest or mortgage and construction loans and then sell the end product for a sale price that leaves satisfactory return to developers	Gentrification is a consequence of major changes in the industrial and occupational resulting in the growth of middleclass professionals Post industrialization changes the occupational structure in capital cities from manufacturing to service industry. This led to expansion of the middle-class professionals or ‘cultural new class’ who preferred to live in the city than suburbs Gentrification is the product of demand for locations in city centers and for public and cultural facilities that will be offered to gentrifies. It depends upon consumption power of new middle class to remove other users from the urban areas.

The process of land pooling in bharat nagar has very few negative impact of gentrification, this is because most of the people owned their lands and majority of them are returned back. And their social perspective is also maintained .
By land pooling technique , There is an improvement in housing condition , land values , quality of living and reduced crime rate and strain on infrastructure . But there will be less displacement of people and loss of social diversity as 60% of the land pooled will be returned back to the people . And this process is only after the acceptance of people living in the area .

IMPACTS OF ‘GENTRIFICATION

Physical Impact : Displacement is one of the most studied negative aspects of gentrification. Displacement in the context of gentrification is defined in the gentrification reader as "forced disenfranchisement (alienation) of poor and working-class people from the spaces and places in which they have legitimate social and historical claims.
it stabilizes further deterioration of the area by encouraging further development of local infrastructure and services.

Socio-cultural Impact :Gentrification changes sociocultural status of an individual's neighborhood which shapes one's behavior and future.

Economical Impact : Improvement of housing conditions in the process of gentrification decentralize the poverty from the declining areas. It increases property value and local revenues.

POSITIVE AND NEGATIVE IMPACTS OF ‘GENTRIFICATION
